PREFACE.

THE present volume concludes the account of the Aglyphodont Colubrine Snakes.

The collection in the British Museum has received by gifts several important additions since the publication of the first volume. Messrs. Godman and Salvin have deposited a complete series of the species obtained by their collectors and described in their great work on the Fauna of Central America. The contributions to the African Fauna have been scarcely less numerous, the Trustees being indebted to Professor Barboza du Bocage for many specimens of East-African species described by him; to H. H. Johnston, Esq., C.B., F. J. Jackson, Esq., and others for species collected in various parts of British Central Africa; and to Dr. J. Anderson, F.R.S., for a remarkably interesting collection of Egyptian Snakes. The collections made by E. W. Oates, Esq., in Upper Burmah contained also a fair proportion of Snakes which were of value as illustrating the Fauna of this previously little explored region.

ALBERT GÜNTHER,

Keeper of the Department of Zoology.

INTRODUCTION.

IN dealing with the multitude of forms of Aglyphodont Colubroids, all of comparatively simple structure, the lack of prominent characters on which to establish genera is seriously felt, and, but for the study of the dentition, satisfactory definitions could not be drawn up. I have therefore, as in the previous volume, supplied numerous outline-figures of jaws to facilitate the understanding of the diagnoses.

I have endeavoured to avoid both extremes of excessive fusion or separation in my attempt to render genera approximately equivalent to those of other groups of Reptiles.

Descriptions of 427 species are given. Of these, 347 are represented in the Collection of the Museum, the number of specimens amounting to 2528.

G. A. BOULENGER.

Zoological Department,
July 28th, 1894.

Fam. 7. COLUBRIDÆ.

Subfam. 2. COLUBRINÆ.

(Continued.)

Synopsis of the Genera.

(Continued from Vol. I. p. 180.)

II. Hypapophyses absent in the posterior dorsal vertebræ, the lower surface of which is smooth or with a low keel.

A. Posterior maxillary teeth increasing in size; anterior maxillary and mandibular teeth strongly enlarged; pupil vertically elliptic.

Anterior maxillary teeth separated from the rest by an interspace.

48. *Lycodon*, I. p. 348.

Two or three middle maxillary teeth small, separated from the anterior and posterior by distinct interspaces.

49. *Dinodon*, I. p. 360.

B. Anterior maxillary teeth not enlarged, middle and posterior longest; pupil vertically elliptic.

50. *Stegonotus*, I. p. 364.

C. Anterior and middle maxillary teeth not enlarged, posterior increasing in size or the last strongly enlarged.

1. Palatine and pterygoid bones toothed; pupil vertically elliptic.

Maxillary teeth 8 to 10; scales with apical pits.

51. *Dryocalamus*, I. p. 369.

Maxillary teeth 6 to 9; scales without pits; snout cuneiform, projecting..... 55. *Lytorhynchus*, I. p. 414.

Maxillary teeth 12 to 16; scales with apical pits.

89. *Hypsiglena*, II. p. 208.

2. Palatine and pterygoid bones toothed; pupil round; anterior mandibular teeth much larger than the posterior; scales with apical pits.

a. Internasal shield entering the nostril; maxillary teeth 12 to 14 52. *Pseudaspis*, I. p. 373.

b. Internasal not entering the nostril.

a. Lateral scales disposed obliquely, at least on the anterior part of the body; eyes large.

Maxillary teeth 15 to 20, the posterior slightly enlarged; scales in 21 to 25 rows 58. *Phrynonax*, II. p. 18.

Maxillary teeth 20 to 32, the posterior strongly enlarged; scales in 13 or 15 rows 71. *Leptophis*, II. p. 105.

β. Scales forming longitudinal series; maxillary teeth 11 to 20.

Posterior maxillary teeth strongly enlarged and separated from the rest by an interspace; scales narrow, lanceolate.

72. *Uromacer*, II. p. 115.

Posterior maxillary teeth slightly enlarged.

73. *Hypsirhynchus*, II. p. 117.

Posterior maxillary teeth strongly enlarged and separated from the rest by an interspace; scales moderately elongate.

74. *Dromicus*, II. p. 118.

3. Palatine and pterygoid bones toothed; pupil round; mandibular teeth subequal, or anterior a little enlarged.

a. Longitudinal series of scales in even numbers; maxillary teeth 20 to 33.

Scales forming longitudinal series.

53. *Zaocys*, I. p. 374.

Lateral scales oblique 63. *Herpetodryas*, II. p. 71.

b. Longitudinal series of scales in odd numbers; ventrals rounded or obtusely angulate laterally; subcaudals not angulate laterally.

a. Maxillary teeth forming a continuous series, or the last two or three separated from the rest by a very short interspace.

- * Head distinct from neck ; eye large or rather large ; body much elongate ; scales with apical pits.

† Scales forming longitudinal series.

Maxillary teeth 12 to 20 54. *Zamenis*, I. p. 379.

Maxillary teeth 25 to 30 ; scales of vertebral row enlarged.
56. *Xenelaphis*, II. p. 7.

Maxillary teeth 22 to 32 ; no suboculars.

57. *Drymobius*, II. p. 8.

†† Scales disposed obliquely, at least on the anterior part of the body ; maxillary teeth 20 to 25.

Lateral scales as long as dorsals. 66. *Chlorophis*, II. p. 91.

Lateral scales much shorter than dorsals.

70. *Thrasops*, II. p. 104.

- ** Head not or but slightly distinct from neck ; eye moderate or small.

† Internasals, nasals, and præfrontals distinct.

‡ Subcaudals in two rows.

Maxillary teeth 14 to 24 ; scales without pits ; tail conical.

81. *Rhadinæa*, II. p. 160.

Maxillary teeth 13 to 16 ; scales without pits ; usually one or more suboculars ; tail long, thick throughout, ending obtusely.

82. *Urotheca*, II. p. 180.

Maxillary teeth 12 to 20, posterior not compressed ; scales with apical pits ; no suboculars . . 88. *Coronella*, II. p. 188.

Maxillary teeth 8 to 11, posterior not compressed ; snout strongly projecting 91. *Cemophora*, II. p. 213.

Maxillary teeth 8 to 12, posterior compressed ; snout more or less projecting 92. *Simotes*, II. p. 214.

‡‡ Subcaudals single ; snout strongly projecting ; maxillary teeth 16 to 19.

90. *Rhinochilus*, II. p. 212.

†† A single præfrontal ; two internasals.

Eye small ; nostril between two nasals.

83. *Trimetopon*, II. p. 184.

Eye very small ; nasal single . . 84. *Hydromorphus*, II. p. 185.

††† A single internasal ; two præfrontals ; nasal semidivided, in contact with the præocular.

Eye rather small ; scales as broad as long.

85. *Dimades*, II. p. 185.

Eye very small 86. *Hydrops*, II. p. 186.

†††† Internasals fused with the præfrontals, nasals fused with the first labial.

87. *Sympholis*, II. p. 188.

β. Posterior maxillary teeth strongly enlarged and separated from the rest by a very distinct interspace.

* Scales with apical pits; snout rounded or obtusely conical.

Scales forming longitudinal series; no suboculars.

75. *Liophis*, II. p. 126.

Scales forming longitudinal series; a series of suboculars.

76. *Cyclagras*, II. p. 144.

Scales disposed obliquely; no suboculars.

77. *Xenodon*, II. p. 144.

** Scales with apical pits; snout projecting, cuneiform.

Scales smooth, in 19 or 21 rows.

78. *Lystrophis*, II. p. 151.

Scales keeled, in 23 to 27 rows. 79. *Heterodon*, II. p. 153.

*** Scales without pits; snout obtuse; head narrow.

80. *Aporophis*, II. p. 157.

c. Longitudinal series of scales in odd numbers; ventrals with a suture-like lateral keel, and a notch on each side corresponding to the keel.

α. Scales of vertebral row not enlarged.

Scales smooth; subcaudals keeled and notched like the ventrals.

67. *Philothamnus*, II. p. 98.

Scales keeled; subcaudals keeled and notched like the ventrals.

68. *Gastropyxis*, II. p. 102.

Scales keeled; subcaudals without keel or notch.

69. *Hapsidophrys*, II. p. 103.

β. Scales of vertebral row enlarged.

64. *Dendrophis*, II. p. 77.

4. Palatine and pterygoid teeth absent or few; maxillary bone short, with 5 to 8 teeth.

α. Maxillary teeth forming an uninterrupted series.

Pupil round; snout projecting, obtuse.

93. *Oligodon*, II. p. 233.

Pupil vertically subelliptic; snout with angular horizontal edge.

94. *Prosymna*, II. p. 246.

- b.* Posterior maxillary teeth separated from the rest by an interspace.

Scales with apical pits 95. *Leptocalamus*, II. p. 249.

Scales without pits 96. *Arrhyton*, II. p. 251.

- D.* Maxillary teeth equal or nearly so, or posterior decreasing in size.

1. Scales with apical pits.

a. Longitudinal series of scales in even numbers; eye large; no suboculars 59. *Spilotes*, II. p. 23.

- b.* Longitudinal series of scales in odd numbers.

a. Head distinct from neck; eye moderate or large; body usually much elongate.

* Maxillary teeth nearly equal; scales forming straight longitudinal series.

Nasals distinct, not fused with the loreal; ventrals rounded or more or less distinctly angulate laterally.

60. *Coluber*, II. p. 24.

Nasal single, fused with the loreal, in contact with the præocular; ventrals sharply angulate laterally.

61. *Synchalinus*, II. p. 70.

Nasals distinct; ventrals and subcaudals with a suture-like lateral keel and a notch on each side corresponding to the keel.

62. *Gonyophis*, II. p. 70.

** Posterior maxillary teeth decreasing in size; scales narrow and oblique; ventrals and subcaudals with a suture-like lateral keel and a notch on each side corresponding to the keel.

65. *Dendrelaphis*, II. p. 87.

- β.* Head not or but slightly distinct from neck.

* Maxillary teeth equal or subequal.

Snout cuneiform; rostral shield with obtuse horizontal keel.

97. *Simophis*, II. p. 253.

Snout beak-shaped, hooked; rostral shield with sharp horizontal keel 98. *Scaphiophis*, II. p. 254.

Snout obtuse or pointed; nasal distinct from the labials.

99. *Contia*, II. p. 255.

Snout pointed; rostral in contact with or approaching the frontal; nasal fused with the first labial.

100. *Ficimia*, II. p. 270.

Snout much depressed, strongly projecting; nasal fused with the internasal 101. *Chilomeniscus*, II. p. 272.

** Anterior maxillary and mandibular teeth longest.
102. *Homalosoma*, II. p. 273.

2. Scales without pits.

a. Maxillary and mandibular teeth subequal, 15 to 35;
pupil round; anterior temporal present.

a. Loreal and præfrontal not entering the eye.

Head not or but slightly distinct from neck; eye moderate or rather small; maxillary teeth 15 to 30.

103. *Ablabes*, II. p. 277.

Head distinct from neck; eye moderate; body stout; maxillary teeth 22 to 25. 104. *Grayia*, II. p. 286.

Head distinct from neck; eye large; maxillary teeth 35.

105. *Xenurophis*, II. p. 288.

β. Loreal and præfrontal entering the eye, which is small.

Nostril lateral, between two nasals.

106. *Virginia*, II. p. 288.

Nostrils directed upwards, in a semidivided nasal; two internasals.

107. *Abastor*, II. p. 289.

Nostril directed upwards, in a semidivided nasal; a single internasal 108. *Farancia*, II. p. 290.

b. Posterior maxillary and mandibular teeth shortest;
anterior temporal usually present.

a. Head distinct from neck; pupil vertically elliptic.

Vertebral row of scales enlarged; eye large.

109. *Petalognathus*, II. p. 292.

Dorsal scales equal; eye moderate or large.

110. *Tropidodipsas*, II. p. 294.

Dorsal scales equal; eye small. 111. *Dirosema*, II. p. 298.

β. Head not distinct from neck; pupil round or vertically subelliptic 112. *Atractus*, II. p. 299. 300

c. Maxillary teeth small, subequal, 8 to 12; anterior temporal present; eye very small.

Nostril in a single nasal; loreal and præfrontal entering the eye.

114. *Carphophis*, II. p. 324.

Nostril between two nasals and the internasal; snout with angular horizontal edge 116. *Geagras*, II. p. 326.

Nostril between a nasal and the first labial.

117. *Macrocalamus*, II. p. 327.

d. Maxillary teeth small, subequal; parietal in contact with labials; eye small or very small.

a. Nostril between two nasals.

Loreal present, entering the eye.

113. *Geophis*, II. p. 314.

No loreal; an azygous shield between the internasals.

118. *Idiopholis*, II. p. 327.

β. Nostril in a single nasal; no loreal.

* Nasal small.

Eye moderately small; body extremely slender.

115. *Stilosoma*, II. p. 325.

Eye very small 119. *Rhabdophidium*, II. p. 328.

** Nasal minute.

Internasals present 120. *Pseudorhabdium*, II. p. 328.

No internasals; eye free 121. *Calamaria*, II. p. 330.

Eye concealed under the ocular shield.

122. *Typhlogeophis*, II. p. 351.

56. XENELAPHIS.

Coryphodon (*non* Owen), part., *Dum. & Bibr. Erp. Gén.* vii. p. 180 (1854); *Günth. Cat. Col. Sn.* p. 107 (1858); *Jan, Elenco sist. Ofid.* p. 63 (1863).

Xenelaphis, *Günth. Rept. Brit. Ind.* p. 250 (1864); *Bouleng. Faun. Ind., Rept.* p. 336 (1890).

Maxillary teeth 25 to 30, gradually increasing in size; anterior mandibular teeth a little enlarged. Head moderately elongate, distinct from neck; eye moderate, with round pupil; a subocular

Fig. 1.

Maxillary and mandible of *Xenelaphis hexagonotus*.

below the præocular. Body elongate, cylindrical; scales smooth, with feebly marked apical pits, in 17 rows, the vertebral row

slightly enlarged and six-sided; ventrals rounded. Tail long; subcaudals in two rows.

Burma, Malay Peninsula and Archipelago.

1. *Xenelaphis hexagonotus*.

Coluber hexagonotus, Cantor, *Cat. Mal. Rept.* p. 74 (1847).

Coryphodon sublutescens, Dum. & Bibr. vii. p. 187 (1854).

— *hexanotus*, Günth. *Cat.* p. 110 (1858).

Xenelaphis hexahonotus, Günth. *Rept. Brit. Ind.* p. 251, pl. xxi. fig. C (1864).

Ptyas hexagonotus, Theob. *Cat. Rept. Brit. Ind.* p. 168 (1876).

Xenelaphis hexagonotus, Bouleng. *Faun. Ind., Rept.* p. 336 (1890).

Rostral broader than deep, visible from above; internasals as long as or a little longer than the præfrontals; frontal once and one third to once and a half as long as broad, as long as its distance from the end of the snout, a little shorter than the parietals; loreal nearly as long as deep; one præocular, with a rather large subocular below it, wedged in between the third and fourth upper labials; two postoculars, with a large subocular below, separating the eye from the fifth and sixth labials; a third subocular occasionally present, separating the eye altogether from the labials; temporals 2+2; normally eight upper labials, fourth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are as long as the posterior. Scales smooth, in 17 rows. Ventrals 185–198; anal divided; subcaudals 140–179. Brown above, with black cross bands, which become indistinct with age, on the anterior half of the body; old specimens showing mere traces of the outer ends of these bands; lower parts uniform yellowish.

Total length 1650 millim.; tail 600.

Burma, Malay Peninsula, Borneo, Sumatra, Java.

Maxillary teeth 22 to 38, increasing in size posteriorly, the two or three last stouter if not longer than those preceding them; mandibular teeth subequal or anterior somewhat enlarged. Head elongate, distinct from neck; eye large, with round pupil; no suboculars. Body elongate, cylindrical; scales smooth or keeled, with apical pits, in 15 or 17 rows; ventrals rounded or with an obtuse lateral keel. Tail long; subcaudals in two rows.

America, from Texas to Peru and Southern Brazil.

This genus is very closely allied to, and intermediate between, both *Zamenis* and *Coluber*. It is just separable from the former by the greater number of teeth; and it is connected with the latter by *D. bifossatus* and *D. boddaertii*, the dentition of some specimens of which approaches the isodont type. The subocular shield below the præocular, present in most of the species referred to *Zamenis*, is constantly absent in *Drymobius*.

Fig. 2.

Maxillary and mandible of *Drymobius bifossatus*.

Synopsis of the Species.

I. Scales smooth.

- | | |
|---|-------------------------------|
| Scales in 15 rows; two labials entering the eye | 1. <i>bifossatus</i> , p. 10. |
| Scales in 17 rows; usually three labials entering the eye | 2. <i>boddaertii</i> , p. 11. |

II. Scales keeled.

- | | |
|----------------------------|----------------------------|
| A. Scales in 15 rows | 3. <i>affinis</i> , p. 14. |
|----------------------------|----------------------------|

B. Scales in 17 rows.

1. Maxillary teeth 30 to 38.

- | | |
|---|-------------------------------|
| Subcaudals 84-96 | 4. <i>rhombifer</i> , p. 14. |
| Subcaudals 109-128; loreal as deep as long. | 5. <i>bivittatus</i> , p. 15. |
| Subcaudals 113-155; loreal usually longer than deep | 6. <i>dendrophis</i> , p. 15. |

2. Maxillary teeth not more than 25.

- | | |
|--|-------------------------------------|
| Frontal hardly once and a half as long as broad; loreal not or but slightly longer than deep; ventrals 158-169 | 7. <i>chloroticus</i> , p. 16. |
| Frontal at least once and a half as long as broad; loreal longer than deep; ventrals 144-159 | 8. <i>margaritiferus</i> , [p. 17.] |

1. *Drymobius bifossatus*.

Coluber bifossatus, *Raddi, Mem. Soc. Ital. Modena*, xviii. (Fis.), 1820, p. 333.

— *capistratus*, *Lichtenst. Verz. Doubl. Mus. Berl.* p. 104 (1823).

Coryphodon pantherinus, *Dum. & Bibr.* vii. p. 181 (1854); *Günth. Cat.* p. 107 (1858); *Jan, Icon. Gén.* 24, pl. iii. fig. 1 (1867).

Drymobius pantherinus, *Cope, Proc. Am. Philos. Soc.* xxii. 1885, p. 192.

Ptyas pantherinus, *Boettg. Zeitschr. f. ges. Naturw.* lviii. 1885, p. 233.

Drymobius bifossatus, *Bouleng. Ann. & Mag. N. H.* (6) xiii. 1894, p. 346.

Maxillary teeth 27 to 30, posterior feebly enlarged. Rostral nearly as deep as broad, visible from above; internasals much shorter than the præfrontals; frontal once and two thirds or once and three fourths as long as broad, as long as or longer than its distance from the rostral, a little shorter than the parietals; loreal as long as deep or deeper than long; one præocular, usually not touching the frontal; two postoculars; temporals 2+2; eight upper labials, fourth and fifth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales smooth, in 15 rows. Ventrals 160-183; anal divided; subcaudals 85-102. Above with three parallel series of large, roundish or subquadrate, blackish or dark brown black-edged spots, separated by narrow yellowish or yellowish-brown interspaces; the spots of the lateral series extending to the sides of the belly; a pair of longitudinal dark bands or a U-shaped band on the back of the head and nape, and a dark cross-band between the eyes; labials yellowish, black-edged; lower parts yellowish, with brown or black spots.

Total length 1750 millim.; tail 450.

— *pleii*, *Bocourt*, l. c. p. 728, fig. 3.

Zamenis melanolomus, *Günth. Biol. C.-Am., Rept.* p. 122 (1894).

Maxillary teeth 22 to 25, posterior moderately or feebly enlarged. Rostral broader than deep, just visible from above; internasals shorter than the præfrontals; frontal once and a half to twice as long as broad, as long as or longer than its distance from the end of the snout, as long as or a little shorter than the parietals; loreal longer than deep; one præocular, rarely touching the frontal; two (rarely three) postoculars; temporals 2+2 or 2+3 (rarely 1+2); nine (rarely eight) upper labials, fourth, fifth, and sixth (or fourth and fifth, or third, fourth, and fifth) entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales smooth, in 17 rows. Ventrals obtusely angulate, 163–204; anal divided; subcaudals 84–136. Coloration very variable.

Total length 1090 millim.; tail 310.

Tropical America.

- A. Brownish, greyish, or olive above, uniform or with a pair of light streaks along part or the whole of the body; the scales sometimes black-edged; a more or less distinct dark streak on each side of the head, through the eye; belly yellowish, uniform or dotted with olive; throat sometimes spotted or marbled with brown. & ♀ (V. 193; C. 112).

3. *Drymobius affinis*.

Herpetodryas affinis, Steindachn. *Sitzb. Ak. Wien*, lxii. 1870, p. 348, pl. vii. figs. 4 & 5.

Rostral just visible from above; internasals a little shorter than the præfrontals; frontal very broad anteriorly, very narrow posteriorly, the lateral border very concave; loreal twice as long as deep; one præocular, in contact with the frontal; two postoculars; temporals 1 + 2; nine upper labials, fifth and sixth entering the eye. Scales in 15 rows, all except the outer row keeled. Olive above, yellowish brown below; upper lip yellow, black-edged below; a black stripe on each side of the head; upper surface of head dotted with black; anterior part of body with five narrow black stripes; gular region blackish, spotted with yellow.

Brazil.

4. *Drymobius rhombifer*.

Coryphodon rhombifer, Günth. *Proc. Zool. Soc.* 1860, p. 236.

Herpetodryas dendrophis, part., Jan, *Icon. Gén.* 31, pl. iii. fig. 1 (1869).

Spilotes rhombifer, Peters, *Mon. Berl. Ac.* 1879, p. 777.

Drymobius rhombifer, Bocourt, *Miss. Sc. Mex., Rept.* pl. xliii. fig. 1 (1888).

Zamenis rhombifer, Günth. *Biol. C.-Am., Rept.* p. 120, pl. xlv. (1894).

Maxillary teeth 30 to 32, posterior moderately enlarged. Rostral broader than deep, just visible from above; internasals much shorter than the præfrontals; frontal once and a half to once and two thirds as long as broad, as long as its distance from the rostral or the end of the snout, a little shorter than the parietals; loreal as long as deep or a little longer; one præocular, not touching the frontal; two postoculars; temporals 2 + 2; nine upper labials, fourth, fifth, and sixth entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales strongly keeled, in 17 rows. Ventrals 148-163; anal divided; subcaudals 84-96. Pale brown above, with a more or less distinct series of large rhomboidal dark spots edged with blackish; lower parts yellowish, with a lateral series of black spots. Total length 950 millim.; tail 300.

Colombia, Ecuador, Northern Peru.

a. Hgr. (V. 153; C. 85). Chiriqui. F. D. Godman, Esq. [P.].

- b. Hgr. (V. 160; C. 94). Colombia.

5. *Drymobius bivittatus*.

- Leptophis bivittatus*, Dum. & Bibr. vii. p. 540 (1854).
Thamnosophis bivittatus, Jan, *Elenco*, p. 82 (1863).
Tropidonotus subradiatus, Jan, *Arch. Zool. Anat. Phys.* iii. 1865,
 p. 227, and *Icon. Gén.* 27, pl. iii. figs. 1 & 2 (1868).
Herpetodryas tetratænia, Günth. *Ann. & Mag. N. H.* (4) ix. 1872,
 p. 23.

Maxillary teeth 32, posterior very feebly enlarged. Rostral broader than deep, just visible from above; internasals shorter than the præfrontals; frontal once and a half as long as broad, a little longer than its distance from the end of the snout, a little shorter than the parietals; loreal as long as deep; one præocular, not touching the frontal; two postoculars; temporals 2 + 2; nine upper labials, fourth, fifth, and sixth entering the eye; five lower labials in contact with the anterior chin-shields, which are much shorter than the posterior. Scales strongly keeled, in 17 rows. Ventrals 147–152; anal divided; subcaudals 109–128. Olive-grey above, neck with black spots; body and tail with two broad black dorsal stripes separated by the width of one scale, and with a black lateral line running along the second series of scales; a black streak on each side of the head, above the lip, which is white; lower parts white, the shields olive-grey at the outer ends and black-edged in front.

Total length 730 millim.; tail 290.

Colombia.

- a. ♂ (V. 151; C. 128). Bogota. (Type of *H. tetratænia*).

Drymobius percarinatus, Cope, *Proc. Amer. Philos. Soc.* xxxi. 1893, p. 344.

Maxillary teeth 32 to 38, posterior moderately enlarged. Rostral broader than deep, visible from above; internasals as long as or a little shorter than the præfrontals; frontal once and a half to once and three fourths as long as broad, as long as its distance from the end of the snout (longer in the young), as long as or a little shorter than the parietals; loreal usually longer than deep; one præocular, not touching the frontal; two or three postoculars; temporals 2 + 2; nine (exceptionally ten) upper labials, fourth, fifth, and sixth (or fifth, sixth, and seventh) entering the eye; five (rarely four) lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales more or less strongly keeled, in 17 rows. Ventrals 150-167; anal entire or divided; subcaudals 113-155. Olive-brown above, uniform or with blackish cross-bands enclosing round whitish spots, or with whitish black-edged cross-bands; upper lip whitish; ventrals and subcaudals olive on the sides, whitish, uniform or dotted or edged with olive, in the middle.

Total length 1020 millim.; tail 420.

From Mexico to Ecuador and the Guianas.

7. *Drymobius chloroticus*.

Dendrophidium chloroticum, Cope, *Proc. Amer. Philos. Soc.* xxiii. 1886, p. 278.

Drymobius chloroticus, Cope, *Bull. U.S. Nat. Mus.* no. 32, 1887, p. 69; *Bocourt, Miss. Sc. Mex., Rept.* p. 718, pl. 1. fig. 7 (1890).
— *brunneus* (non Günth.), *Bocourt, l. c.* pl. 1. fig. 6.

Maxillary teeth not more than 25, posterior rather strongly enlarged. Rostral broader than deep, visible from above; internasals shorter than the præfrontals; frontal hardly once and a half as long as broad, as long as its distance from the end of the snout, a little shorter than the parietals; loreal not or but slightly longer

than deep; one præ- and two postoculars; temporals 2+2; nine upper labials, fourth, fifth, and sixth entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 17 rows, dorsals keeled. Ventrals 158-169; anal divided; subcaudals 114-117. Green above; ventrals yellow in the middle, green on the sides; young sometimes with black cross bars.

Total length 1280 millim.; tail 400.

Guatemala.

8. *Drymobius margaritiferus*.

Herpetodryas margaritiferus, Schleg. *Phys. Serp.* ii. p. 184 (1837), and *Abbild.* pl. xliv. figs. 19 & 20 (1844).

Drymobius margaritiferus, var. *occidentalis*, *Bocourt, l. c.* p. 718.

Maxillary teeth 24 or 25, posterior strongly enlarged. Rostral broader than deep, visible from above; internasals shorter than the præfrontals; frontal once and a half to once and three fourths as long as broad, as long as its distance from the rostral or the end of the snout, as long as or slightly shorter than the parietals; loreal longer than deep; one præocular, not touching the frontal; two or three postoculars; temporals 2+2; nine upper labials, fourth, fifth, and sixth entering the eye; five (rarely four) lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales more or less distinctly keeled, in 17 rows. Ventrals 144-159; anal divided; subcaudals 101-126. Black above, each scale green at the base and with a yellow elongate spot or longitudinal streak; head pale brown or olive above, black on the temples; labials yellow, with black sutures; ventrals and subcaudals yellow, black-edged.

Total length 1260 millim.; tail 430.

From South-western Texas and Mexico to Colombia and Venezuela.

58. **PHRYNONAX.**

Spilotes, part., *Dum. & Bibr. Erp. Gén.* vii. p. 218 (1854); *Günth. Cat. Col. Sn.* p. 96 (1858); *Jan, Elenco sist. Ofid.* p. 62 (1863); *Bocourt, Miss. Sc. Mex., Rept.* p. 685 (1888).
Phrynonax, *Cope, Proc. Ac. Philad.* 1862, p. 348.

Maxillary teeth 15 to 20, the posterior slightly enlarged; anterior mandibular teeth longest. Head distinct from neck; eye large, with round pupil; no suboculars. Body elongate, compressed; scales more or less distinctly keeled, disposed obliquely on the sides, in 21 to 25 rows; ventrals obtusely angulate laterally. Tail long; subcaudals in two rows.

Tropical America.

Fig. 3.

Maxillary and mandible of *Phrynonax sulphureus*.*Synopsis of the Species.*

I. Scales in 21 or 23 rows.

A. Scales strongly keeled on the middle of the back.

- Three postoculars; temporals 1+1 1. *sulphureus*, p. 19.
Two postoculars; temporals 2+2 2. *pacilonotus*, p. 20.

B. Scales feebly keeled.

- Præocular separated from the frontal;
ten upper labials 3. *guentheri*, p. 20.
Præocular separated from the frontal;
nine upper labials 4. *lunulatus*, p. 21.

Præocular in contact with or narrowly separated from the frontal; eight or nine upper labials..... 5. *fasciatus*, p. 21.

II. Scales in 25 rows.

Dorsal scales very strongly keeled 6. *eutropis*, p. 22.
Scales smooth, except the row next to the vertebral, which is feebly keeled . 7. *chrysobronchus*, p. 22.

Spilotes poecilostoma, *Dum. & Bibr.* vii. p. 221 (1854); *Günth. Cat.* p. 100 (1858); *Jan, Icon. Gén.* 48, pl. v. figs. 3 & 4 (1876).

Rostral broader than deep, visible from above; internasals as long as or a little shorter than the præfrontals; frontal as long as broad or slightly longer, as long as its distance from the rostral or the end of the snout, shorter than the parietals; loreal longer than deep; one præocular, not reaching the frontal; three postoculars; temporals 1+1; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are as long as or a little shorter than the posterior. Scales in 21 rows, all except the outer row strongly keeled. Ventrals distinctly angulate, 208-226; anal entire; subcaudals 126-144. Yellowish, olive, or brown above, with or without black spots or irregular cross bars; the keels of the scales black; belly yellow or olive, sometimes turning to black posteriorly.

Total length 2700 millim.; tail 720.

Guianas, Brazil, North-eastern Peru, Ecuador.

A. Labials without black margins; tail olive or brown.

2. *Phrynonax pœcilonotus*.

Spilotes pœcilonotus, part., *Günth. Cat.* p. 100 (1858), and *Biol. C.-Am., Rept.* p. 117, pl. xliii. (1894).

? *Spilotes pœcilonotus*, *Bocourt, Miss. Sc. Mex., Rept.* p. 691, pl. xliii. fig. 4 (1888).

Spilotes argus, *Bocourt, l. c.* p. 692, pl. xlviii. fig. 10.*

Rostral broader than deep, just visible from above; internasals shorter than the præfrontals; frontal a little longer than broad, as long as its distance from the rostral, nearly as long as the parietals; loreal longer than deep; one præocular, not in contact with the frontal; two postoculars; temporals 2+2; eight or nine upper labials, fourth and fifth, or fourth, fifth, and sixth, entering the eye; six or seven lower labials in contact with the anterior chin-shields, which are as long as or a little shorter than the posterior. Scales in 23 rows, the dorsals very strongly keeled, the keels forming continuous raised lines in the middle of the body. Ventrals obtusely angulate laterally, 201-208; anal entire; subcaudals 126-133. Blackish brown above, with yellow spots which may form a vertebral stripe; upper lip yellow, with black edges to the shields; ventrals yellow with blackish edge; posterior portion of body and tail dark brown or black above and below.

Total length 1800 millim.; tail 500.

Central America.

3. *Phrynonax guentheri*.

Spilotes argus (*non Bocourt*), *Günth. Biol. C.-Am., Rept.* p. 118, pl. xliv. (1894).

Rostral a little broader than deep, just visible from above; internasals a little shorter than the præfrontals; frontal a little longer than broad, as long as its distance from the rostral, a little shorter than the parietals; loreal longer than deep; one præocular, not in contact with the frontal; two postoculars; temporals 2+2; ten upper labials, sixth and seventh, or fifth, sixth, and seventh, entering the eye; seven lower labials in contact with the anterior chin-shields, which are much longer than the posterior. Scales in 23 rows, median dorsals faintly keeled. Ventrals obtusely angulate laterally, 213; anal entire. Black above, each scale with a yellowish spot; the spots on the three vertebral series larger, forming a light stripe bordered with black; lateral scales greyish, with black border; head black above, with small yellowish spots; tail black, with yellowish spots forming four stripes, one above, one beneath, and one on each side; anterior ventrals yellowish, black-edged, posterior dark grey to black.

* I have examined the type specimen in the Brussels Museum.

Total length 1360 millim.

Mexico.

6. *Phrynonax eutropis*. (PLATE I. fig. 1.)

Spilotes fasciatus, part., *Günth. Ann. & Mag. N. H.* (4) ix. 1872, p. 20.

Rostral broader than deep, just visible from above; internasals as long as the præfrontals; frontal slightly longer than broad, as long as its distance from the end of the snout, as long as the parietals; loreal longer than deep; one præocular, forming a suture with the frontal; two postoculars; temporals 2+2; eight upper labials, fourth, fifth, and sixth entering the eye, eighth very long; seven or eight lower labials in contact with the anterior chin-shields, which are much shorter than the posterior. Scales in 25 rows, the dorsals very strongly keeled, the keels forming continuous raised lines in the middle of the body. Ventrals very obtusely angulate, 191; anal entire; subcaudals 126. Uniform brown above; upper lip and anterior lower surfaces yellow; belly turning to olive-brown towards the tail.

Total length 1450 millim.; tail 430.

Habitat unknown.

- a. ♂ (V. 191; C. 126). — ?

7. *Phrynonax chrysobronchus*.

Spilotes chrysobronchus, *Cope, Journ. Ac. Philad.* (2) viii. 1876, p. 136, pl. xxviii. fig. 11; *Bocourt, Miss. Sc. Mex., Rept.* p. 695 (1888).

Rostral as deep as broad; internasals nearly as long as the præfrontals; frontal about once and two fifths as long as broad, as long as its distance from the end of the snout, as long as the parietals; loreal longer than deep; one præocular, nearly touching the frontal; two postoculars; temporals 2+2; seven upper labials, third, fourth, and fifth entering the eye, last very long; seven lower labials in contact with the anterior chin-shields, which are nearly as long as the posterior. Scales in 25 rows, all smooth except the row next to the vertebral, which is weakly keeled. Ventrals 220; anal entire; subcaudals 117. Brown, the scales dotted with lighter; head darker; one or more borders of the scales black; upper lip, throat, and anterior part of belly yellow; remainder of lower surfaces passing from brown to black below the tail.

Total length 1670 millim.; tail 422.

Coast of Costa Rica.

Skull of *Coluber constrictor*.

Maxillary teeth 12 to 22, subequal in size; anterior mandibular teeth longest. Head distinct from neck, elongate; eye moderate or rather large, with round pupil; loreal sometimes absent. Body elongate, cylindrical or feebly compressed; scales smooth or keeled, with apical pits, in 15 to 35 rows; ventrals rounded or angulate laterally. Tail moderate or long; subcaudals in two rows.

Europe, Asia, North and Tropical America.

The species comprised under this genus form a series nearly parallel to that obtained in *Zamenis*, the extreme forms of both these genera showing much the same amount of differentiation.

Synopsis of the Species.

I. Rostral shield not deeper than broad, the portion visible from above not half as long as its distance from the frontal.

A. Ventrals without or with a rather indistinct lateral keel*.

1. Scales in 15 to 19 rows.

a. Anal entire.

- | | |
|---|--------------------------------------|
| Scales in 15 rows, smooth..... | 1. <i>dichrous</i> , p. 30. |
| Scales in 17 rows, smooth or feebly keeled. | 2. <i>corais</i> , p. 31. |
| Scales in 19 rows; dorsals more or less distinctly keeled | [p. 33.
3. <i>novæ-hispaniæ</i> , |

b. Anal divided.

- | | |
|---------------------------------|---------------------------------|
| Scales in 17 rows, keeled | 4. <i>melanotropis</i> , p. 33. |
| Scales in 19 rows, smooth..... | 5. <i>porphyraceus</i> , p. 34. |

2. Scales in 21 rows or more (rarely 19 in *C. cantoris*), smooth or feebly keeled.

a. Anal usually entire.

- | | |
|--|---------------------------|
| Scales in 19 or 21 rows; subcaudals 65-76. | 6. <i>cantis</i> , p. 35. |
| Scales in 23 to 27 rows; subcaudals 75-94. | 8. <i>helenæ</i> , p. 36. |

b. Anal usually divided.

a. Scales smooth or faintly keeled.

* Rostral as broad as deep.

- | | |
|---|------------------------------|
| Scales in 23 rows; subcaudals 79-90 | 7. <i>hodgsonii</i> , p. 35. |
| Scales in 31 to 35 rows; subcaudals 91-119. | 9. <i>triaspis</i> , p. 37. |

* In some doubtful cases it will be necessary to try, also, division B of this key.

** Rostral broader than deep.

† No subocular below the præocular.

‡ Scales in 23 rows or more; third labial not entering the eye.

- Scales in 33 rows, smooth or faintly keeled;
 ventrals 247-260; subcaudals 112 10. *chlorosoma*, p. 38.
 Scales in 27 to 33 rows, faintly keeled;
 ventrals 252-266; subcaudals 102-119. 11. *flavirufus*, p. 39.
 Scales in 25 to 31 rows, faintly keeled on
 the posterior part of the body; ventrals
 200-239; subcaudals 60-88. 12. *guttatus*, p. 39.
 Scales in 25 or 27 rows, all perfectly smooth;
 ventrals 222-260; subcaudals 68-89 . . 13. *leopardinus*, p. 41.
 Scales in 23 or 25 rows; ventrals 201-228;
 subcaudals 60-66 14. *hohenackeri*, p. 42.

‡‡ Scales in 23 rows; third and fourth labials
 entering the eye; ventrals 208-222; sub-
 caudals 62-74. 15. *mandarinus*, p. 42.

‡‡‡ Scales in 21 rows; ventrals 162-190; sub-
 caudals 47-68. 16. *rufodorsatus*, p. 43.

†† A subocular below the præocular; scales in 23
 to 27 rows; ventrals 172-214; subcaudals 50-
 80 17. *dione*, p. 44.

β. Scales feebly but distinctly keeled, in 23 or 25 rows.

* Frontal considerably longer than broad. [p. 45.]

- Ventrals 195-234; subcaudals 63-90 18. *quatuorlineatus*,
 Ventrals 230-284; subcaudals 90-107 . . 19. *teniurus*, p. 47.

** Frontal not or but slightly longer than broad.

- Scales in 23 rows; ventrals 208-221; sub-
 caudals 61-76; loreal considerably
 longer than deep 20. *schrenckii*, p. 48.
 Scales in 25 rows (rarely 23 or 27); ventrals
 200-234; subcaudals 67-85 21. *vulpinus*, p. 49.

3. Scales strongly keeled, in 27 rows. 40. *lineaticollis*, p. 64.

B. Ventrals with a distinct, though often very obtuse, lateral keel.

1. Anal usually divided; scales in 21 rows or more.

a. Subcaudals less than 125.

α. No subocular below the præocular.

* Scales in 25 to 29 rows.

Scales smooth or very faintly keeled. 22. *latus*, p. 49.

Scales very distinctly keeled 23. *obsoletus*, p. 50.

** Scales in 21 or 23 rows.

[p. 51.

Third and fourth labials entering the eye. . . 24. *conspicillatus*,

Fourth and fifth labials entering the eye. . . 25. *longissimus*, p. 52.

β. A subocular below the præocular.

* Scales in 23 or 25 rows.

Scales feebly keeled; ventrals 226-244; [p. 54.

subcaudals 97-122 26. *climacophorus*,

Scales strongly keeled; ventrals 209-220;

subcaudals 80-96 27. *phyllophis*, p. 55.

Scales strongly keeled; ventrals 173; sub-

caudals 70 28. *davidi*, p. 56.

** Scales in 27 rows; ventrals 268-274; subcaudals

97-99 29. *moellendorffii*, p. 56.

b. Subcaudals 122-149; scales smooth or faintly keeled, in
23 to 27 rows; ventrals 236-263.

Two labials entering the eye; green above. 30. *oxycephalus*, p. 56

Three labials entering the eye; tail black. . . 31. *janseni*, p. 57.

2. Anal usually divided; scales in 17 or 19 rows; ventrals
193-210.

a. Scales in 19 rows.

a. Three labials entering the eye.

No loreal; subcaudals 120-121 32. *frenatus*, p. 58.

A loreal; subcaudals 91-107 33. *prasinus*, p. 59.

β. Two labials entering the eye; subcaudals 70-96.

3. Anal entire; scales keeled. 34. *quadrivirgatus*, p. 59.

a. Scales in 19 rows, 21 on the neck.

All caudal scales keeled. 35. *melanurus*, p. 60.

Outer caudal scales smooth 36. *radiatus*, p. 61.

b. Scales in 21 rows, 23 on the neck. 37. *erythrurus*, p. 62.

c. Scales in 23 or 25 rows, 25 or 27 on the neck.

Rostral a little broader than deep; three

labials entering the eye. 38. *enganensis*, p. 63.

Rostral much broader than deep; two la-

bials entering the eye 39. *subradiatus*, p. 64.

II. The portion of the rostral shield visible from above measuring
at least half its distance from the rostral.

A. Scales smooth.

Rostral deeper than broad; anal usually

divided 41. *scalaris*, p. 65.

Rostral as deep as broad; anal entire 42. *arizonæ*, p. 66.

B. Scales keeled; anal entire.

A pair of præfrontals; two labials entering the eye; rostral not or but slightly deeper than broad; scales in 27 or 29 rows 43. *deppii*, p. 66.

Præfrontals usually broken up into two pairs or more; not more than one labial entering the eye; rostral not or but slightly deeper than broad; scales in 29 to 35 rows 44. *catenifer*, p. 67.

Præfrontals broken up into two pairs or more; rostral much deeper than broad, the portion visible from above measuring more than half its distance from the frontal; scales in 29 to 35 rows 45. *melanoleucus*, p. 68.

TABLE SHOWING NUMBERS OF SCALES AND SHIELDS.

I. Old-World species.

	Sc.	V.	A.	C.	Labials entering eye.
<i>porphyraceus</i>	19	190-215	2	52-76	4th, 5th.
<i>cantoris</i>	19-21	213-232	1-2	65-78	4th, 5th.
<i>hodgsonii</i>	23	233-246	2	79-90	4th, 5th.
<i>helena</i>	23-27	220-265	1	75-94	5th, 6th, or 4th, 5th, 6th.
<i>leopardinus</i>	25-27	222-260	2	68-89	4th, 5th.
<i>hohenackeri</i>	23-25	201-228	2	60-66	4th, 5th.
<i>mandarinus</i>	23	208-222	2	62-74	3rd, 4th.
<i>rufodorsatus</i>	21	162-190	2	47-68	3rd, 4th, or 4th, 5th.
<i>dione</i>	23-27	172-214	2	50-80	4th, 5th, or 5th, 6th.
<i>quadrilineatus</i>	23-25	195-234	2	63-90	4th, 5th, or 5th, 6th.
<i>temiurus</i>	23-25	230-284	1-2	90-107	4th, 5th, or 5th, 6th.
<i>schrenckii</i>	23	208-221	2	61-76	4th, 5th.
<i>conspicillatus</i>	21	200-224	2	60-76	3rd, 4th.
<i>longissimus</i>	21-23	212-248	2	60-91	4th, 5th, or 5th, 6th.
<i>climacophorus</i>	23-25	226-244	1-2	97-122	4th, 5th.
<i>phyllophis</i>	23	209-220	1-2	80-96	4th, 5th, or 5th, 6th.
<i>davidi</i>	23	173	2	70	4th, 5th.
<i>moellendorffii</i>	27	268-274	2	97-99	6th, 7th.
<i>oxycephalus</i>	23-27	233-263	2	122-149	5th, 6th, or 6th, 7th.
<i>janseni</i>	23-25	247-255	2	133-140	5th, 6th, 7th.
<i>frenatus</i>	19	203-204	2	120-121	4th, 5th, 6th.
<i>prasinus</i>	19	198-206	1-2	91-107	4th, 5th, 6th.
<i>quadrivirgatus</i>	19	193-210	1-2	70-96	4th, 5th.
<i>melanurus</i>	19	193-234	1	89-109	4th, 5th, 6th.
<i>radiatus</i>	19	224-242	1	85-100	3rd, 4th, 5th, or 4th, 5th, 6th.
<i>erythrurus</i>	21	211-233	1	86-100	4th, 5th, 6th.
<i>engauensis</i>	23	239-243	1	107-108	5th, 6th.
<i>subradiatus</i>	23-25	228-242	1	80-100	5th, 6th.
<i>scalaris</i>	25-29	201-220	1-2	48-68	4th or 4th, 5th.

II. American species.

	Sc.	V.	A.	C.	Labials entering eye.
<i>dichrous</i>	15	161-176	1	87-101	4th, 5th, or 3rd, 4th, 5th.
<i>corais</i>	17	184-215	1	53-83	3rd, 4th, or 4th, 5th.
<i>nove-hispaniæ</i>	19	204-222	1	115-138	4th, 5th.
<i>melanotropis</i>	17	152	2	94	4th, 5th, 6th.
<i>triaspis</i>	31-35	243-282	2	91-119	4th, 5th, or 5th, 6th.
<i>chlorosoma</i>	33	247-260	2	107-112	4th, 5th, or 5th, 6th.
<i>flavirufus</i>	27-33	252-266	2	102-119	4th, 5th, or 4th, 5th, 6th.
<i>guttatus</i>	25-31	200-239	2	60-88	4th, 5th.
<i>vulpinus</i>	23-27	200-234	2	67-85	4th, 5th.
<i>letus</i>	25-29	220-240	2	72-81	4th, 5th.
<i>obsoletus</i>	25-29	217-245	2	72-93	4th, 5th.
<i>lineaticollis</i>	27	244	1	69	4th, 5th, or 4th, 5th, 6th.
<i>arizonæ</i>	27-31	212-227	1	46-59	4th, 5th.
<i>deppii</i>	27-29	209-233	1	51-67	3rd, 4th, or 4th, 5th.
<i>catenifer</i>	29-35	204-245	1	66-72	4th or 0.
<i>melanoleucus</i>	29-35	209-239	1	45-65	4th or 5th.

1. *Coluber dichrous*.

Herpetodryas dichroa, *Peters, Mon. Berl. Ac.* 1863, p. 284.

— *occipitalis*, *Günth. Ann. & Mag. N. H.* (4) i. 1868, p. 420, and ix. 1872, p. 23.

Spilotes piceus, *Cope, Proc. Ac. Philad.* 1868, p. 105, and *Journ. Ac. Philad.* (2) viii. 1876, p. 180.

Rostral broader than deep, visible from above; internasals broader than long, shorter than the præfrontals; frontal nearly once and a half as long as broad, a little longer than its distance from the end of the snout, shorter than the parietals; loreal nearly as long as deep; one præ- and two postoculars; temporals 2+2, rarely 1+2; eight upper labials, fourth and fifth, and usually also the third, entering the eye; four or five lower labials in contact with the anterior chin-shields, which are much shorter than the posterior. Scales smooth, in 15 rows. Ventrals 161-176; anal entire; subcaudals 87-101. Adult uniform olive-brown or blackish olive above and on the sides of the ventrals, yellowish white inferiorly. Young black above, with narrow yellowish cross bands; head yellow or pale olive, the shields on the snout edged with black, with a large black patch covering the forehead, a black spot below the eye, and a blackish bar across the occipital region, or a pair of large black blotches on the parietal shields and on the occiput.

Total length 1310 millim.; tail 360.

Brazil and North-eastern Peru.

Rostral broader than deep, visible from above; internasals as long as broad or a little broader, shorter than the præfrontals; frontal as long as broad or a little longer, as long as its distance from the rostral or the end of the snout, much shorter than the parietals; loreal nearly as long as deep; one præ- or two post-oculars; rarely a small subocular below the præocular; temporals 2+2; eight (rarely seven) upper labials, fourth and fifth (or third and fourth) entering the eye; four lower labials in contact with the anterior chin-shields, which are as long as or a little longer than the posterior. Scales in 17 rows (19 or 21 on the neck), smooth, or with a short and feeble keel, disposed somewhat obliquely in the

young. Ventrals without keel, 184-215; anal entire; subcaudals 53-83. Brown to black above, yellow to black inferiorly.

Total length 1880 millim.; tail 400.

From the Southern United States to Brazil and Bolivia.

A. Belly and lower surface of tail uniform yellow; no black on the labials. (*C. corais*, Boie; *C. flaviventris*, Steind.)

Bocourt, Miss. Sc. Mex., Rept. p. 689, pl. xlv. fig. 5 (1888).

Rostral broader than deep, visible from above; internasals as long as broad or a little broader than long, shorter than the præfrontals; frontal as long as or a little longer than broad, as long as its distance from the rostral or the end of the snout, as long as or a little shorter than the parietals; loreal small, as long as deep or a little longer; one præ- and two postoculars; temporals 1+1 or 1+2; eight upper labials, fourth and fifth entering the eye, seventh and eighth very large; three to five lower labials in contact with the anterior chin-shields, which are as long as or a little shorter than the posterior. Scales in 19 rows (17 and 18 in spec. *h*), dorsals more or less distinctly keeled. Ventrals 204–222; anal entire; subcaudals 115–138. Black above, varied with yellow, the yellow forming regular cross bands on the posterior part of the body and on the tail; belly yellow, with irregular black spots.

Total length 2120 millim.; tail 550.

Mexico and Central America.

Elaphis melanotropis, Cope, Bull. U.S. Nat. Mus. no. 32, 1887, p. 71.

Rostral broader than deep; frontal bell-shaped, wide in front, contracted behind, as long as the parietals; loreal much longer than deep; one præocular, with a subocular below it; two postoculars; temporals 2+2; nine upper labials, fourth, fifth, and sixth entering

the eye. Scales in 17 rows, all keeled except the two outer on each side; the keels on the row on each side of the vertebral strongest. Ventrals not angulate, 152; anal divided; subcaudals 94. Green above and on the outer fourth of the ventral shields, yellow beneath; the keels of the median three dorsal rows black.

Total length 1240 millim.; tail 365.

Costa Rica.

5. *Coluber porphyraceus*.

20. *Coluber schrenckii*.

Elaphis schrenckii, *Strauch, Schl. Russ. R.* p. 100 (1873).

Coluber schrenckii, *Bouleng. Ann. & Mag. N. H.* (6) v. 1890, p. 139.

Eye rather small. Rostral broader than deep, just visible from above; internasals broader than long, shorter than the præfrontals; frontal slightly longer than broad, as long as or shorter than its distance from the end of the snout, shorter than the parietals; loreal considerably longer than deep; one præocular, with (or without) a small subocular below it; two postoculars; temporals 2+3; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are a little longer than the posterior. Scales in 23 rows, feebly but distinctly keeled, outer rows smooth. Ventrals not distinctly angulate laterally, 208-221; anal divided; subcaudals 61-76. Brown or black above, uniform or with more or less regular pale brown cross bands, disposed obliquely, and bifurcating on the sides; lips black and yellow; belly yellowish, uniform or closely spotted or checkered with black.

Total length 1430 millim.; tail 230.

Amoorland, Corea, and Northern Japan.

A. Brown (young) or black above, with paler oblique cross bands; belly closely spotted with black.

- a.* ♀ (V. 220; C. 68). Ussuri R. Warsaw Museum [E].
b. Yg. (V. 210; C. 68). Seoul, Corea. C. W. Campbell, Esq. [P].

B. Uniform brown above, yellowish beneath, the caudal shields edged with brown.

c. ♂ (V. 216; C. 76). Seoul, Corea. C. W. Campbell, Esq. [P.].

21. *Coluber vulpinus*.

Scotophis vulpinus, Baird & Gir. Cat. N. Am. Rept. p. 75 (1853), and Rep. Explor. Surv. R. Miss. R. x. pl. xxix. fig. 51 (1859); Hay, Batr. & Rept. Indiana, p. 90 (1893).

Coluber vulpinus, Cope, Check-List N. Am. Rept. p. 39 (1875).

Elaphis guttatus, var. *vulpinus*, Garm. N. Am. Rept. p. 56 (1883).

Eye rather small. Rostral broader than deep, the portion visible from above measuring one third its distance from the frontal; internasals broader than long, much shorter than the præfrontals; frontal nearly as long as broad, as long as its distance from the rostral, shorter than the parietals; loreal as long as deep; one præ- and two postoculars; temporals 2+3; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are a little longer than the posterior. Scales in 25 (rarely 23 or 27) rows, dorsals feebly but very distinctly keeled. Ventrals 200-234; anal divided; subcaudals 67-85. Yellowish brown above, with a dorsal series of large chestnut-brown black-edged spots and an alternating lateral series of smaller spots; head with indistinct dark markings; two dark stripes along the occiput and nape; lower parts yellowish, checkered with black.

Total length 960 millim.

Northern United States east of the Rocky Mountains (Minnesota, Michigan, Wisconsin, Indiana).

Rostral nearly twice as broad as deep, visible from above; inter-
nasals much broader than long, shorter than the præfrontals;
frontal a little longer than broad, as long as its distance from the
end of the snout, shorter than the parietals; loreal longer than
deep; one præ- and two postoculars; temporals 1+2 or 2+2;
seven upper labials, third and fourth entering the eye; four lower
labials in contact with the anterior chin-shields, which are a little
longer than the posterior. Scales smooth, or faintly keeled on the
posterior part of the body, in 21 rows. Ventrals distinctly angu-
late laterally, 200-224; anal divided; subcaudals 60-76. Pale

brown above, with small black spots or a dorsal series of black cross bars; some adult specimens almost uniform olive-brown above; a black streak across the end of the snout, passing through the nostrils, a curved one from eye to eye, another from the eye to the angle of the mouth, a Λ -shaped one on the back of the head, with the point on the frontal, and a black spot or vertical streak below the eye; lower parts whitish, checkered with black. Young (*e*) vermilion above, with small black spots edged with yellowish white.

Total length 830 millim.; tail 150.

c. ♂ (Sc. 21; V. 223; C. 82.) Nantes.

d-f. ♂ (Sc. 23; V. 220; C. 83), ♀ (Sc. 23; V. 231; C. 77), & hgr. (Sc. 23; V. 226; C. 86). Schlangenbad. Dr. Günther [P.].

* The report of the occurrence of *C. quatuorlineatus* at Saumur, Maine-et-Loire (Millet, *Faune de Maine-et-Loire*, p. 629), is evidently based on such a striped specimen, as pointed out by Viaud-Grandmarais.

† I have expressed doubts (*Zool.* 1894, p. 14) as to whether a large specimen (1280 millim. long) with 218 ventral shields, from the island of Seeland, had been correctly referred by Sarauw to *Coronella austriaca*. Further notes on that specimen, captured at Peterswarft in 1863, and now preserved in the Seminary at Skaarup, which Mr. Sarauw subsequently sent me at my request, accompanied by a sketch of the head, changed my doubts into certainty: the Peterswarft snake belongs to a distinct species, which turns out to be *Coluber longissimus*. Three specimens have been examined by Mr. Sarauw, which are perhaps the last survivors of a snake formerly inhabiting the forests of Southern Seeland. It appears that, so far, no authentic specimen of *Coronella austriaca* is known from Denmark.

28. *Coluber davidi*.

Tropidonotus davidi, *Sauvage, Bull. Soc. Philom.* (7) viii. 1884, p. 144*.

Snout slightly projecting; eye rather large. Rostral visible from above; internasals as long as broad, two thirds the length of the præfrontals; frontal twice as long as broad, as long as its distance from the end of the snout, not longer than the parietals; loreal longer than deep; two præoculars, with a subocular below them; two postoculars; temporals 2+3 or 3+4; eight upper labials, fourth and fifth entering the eye. Scales in 23 rows, strongly keeled, outer row smooth. Ventrals 173; anal divided; subcaudals 70. Yellowish brown, with large irregular brown spots; head without any markings.

Total length 750 millim.; tail 160.

China.

29. *Coluber moellendorffii*.

Cynophis moellendorffii, *Boettg. Zool. Anz.* 1886, p. 520, and *Ber. Offenb. Ver. Naturk.* 1888, p. 72, pl. i. fig. 1.

Rostral broader than deep, visible from above; internasals broader than long, hardly half as long as the præfrontals; frontal a little longer than broad, not quite as long as its distance from the rostral, a little shorter than the parietals; loreal twice as long as deep; a large præocular, in contact with the frontal, with a subocular below it; two postoculars; temporals 2+3 or 2+2; ten upper labials, sixth and seventh entering the eye; five lower labials in contact with the anterior chin-shields, which are as long as the posterior. Scales in 27 rows, feebly but distinctly keeled, outer rows smooth. Ventrals obtusely keeled laterally, 268-274; anal divided; subcaudals 97-99. Grey above, with a dorsal series of large, dark grey, black-edged hexagonal spots, and a lateral series of alternating smaller spots; yellowish-white inferiorly, largely checkered with black.

Total length 1655 millim.; tail 310.

Nanning and Canton, China.

30. *Coluber oxycephalus*.

Coluber oxycephalus, *Boie, Isis*, 1827, p. 537; *Bouleng. Faun. Ind., Rept.* p. 335 (1890); *W. Sclater, Journ. As. Soc. Beng. ix.* 1891, p. 239.

* I am indebted to Dr. Mocquard for notes on, and a sketch of, the head of the type specimen preserved in the Paris Museum.

Gonyosoma viride, *Wagl. Icon. Amph.* pl. ix. (1828).

Herpetodryas oxycephalus, *Schleg. Phys. Serp.* ii. p. 189, pl. vii. figs. 8 & 9 (1837), and *Abbild.* pl. xlv. figs. 1-9 (1844); *Cantor, Cat. Mal. Rept.* p. 80 (1847).

Alopecophis chalybeus, *Gray, Ann. & Mag. N. H.* (2) iv. 1849, p. 247.

Gonyosoma oxycephalum, *Dum. & Bibr.* vii. p. 213 (1854); *Günth. Cat.* p. 122 (1858), and *Rept. Brit. Ind.* p. 294 (1864); *Jan, Icon. Gén.* 31, pl. i. (1869); *Stoliczka, Journ. As. Soc. Beng.* xxxix. 1870, p. 193, & xlii. 1873, p. 123; *Theob. Cat. Rept. Brit. Ind.* p. 189 (1876).

Body rather compressed. Snout subacuminate, elongate, obliquely truncate and projecting; rostral nearly as deep as broad, visible from above; internasals one half to two thirds as long as the præ-frontals, which are more than half as long as the parietals; frontal as long as broad, or a little longer, as long as its distance from the rostral or the end of the snout, a little shorter than the parietals; loreal very elongate; one large præocular, in contact with the frontal; two postoculars; temporals 2+3; nine to eleven upper labials, two (rarely three) of which (fifth and sixth or sixth and seventh) enter the eye; six lower labials in contact with the anterior chin-shields, which are much longer than the posterior. Scales in 23 to 27 rows, smooth or faintly keeled. Ventrals with a lateral keel, 233 to 263; anal divided; subcaudals 122-149. Bright green above, the scales usually finely edged with black; yellowish or pale green below; a blackish streak along each side of the head, passing through the eye; tail usually yellowish brown.

Total length 2300 millim.; tail 480.

Eastern Himalayas, Malay Peninsula and Archipelago.

— *bilineatus*, Hallow. *Proc. Ac. Philad.* 1860, p. 497.

Eye rather large; rostral broader than deep, just visible from above; internasals broader than long, shorter than the præfrontals; frontal once and three fifths to twice as long as broad, longer than its distance from the end of the snout, as long as or a little shorter than the parietals; loreal usually as long as deep, or a little deeper; one præocular, usually with a subocular below it; two postoculars; temporals 2+2 or 2+3; eight upper labials, fourth and fifth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are as long as or longer than the posterior. Scales in 19 rows, feebly but distinctly keeled (some-

times nearly smooth in the young), outer rows smooth. Ventrals distinctly angulate laterally, 193-210; anal divided, rarely entire; subcaudals 70-96. Greyish olive or pale brown above, with darker spots or cross bars, or with a pair of dark stripes running along each side of the back; a dark streak from the eye to the angle of the mouth; lower parts yellowish clouded with olive-grey, or olive-grey to blackish, the lateral ventral keels always lighter. Some specimens entirely black, with the exception of the lips and throat, which are yellowish.

Total length 1030 millim.; tail 240.

38. *Coluber enganensis*.

Coluber enganensis, Vinciguerra, *Ann. Mus. Genova*, (2) xii. 1892, p. 524.

Intermediate between *C. erythrurus* and *C. subradiatus*. Differing from the former in the more numerous scales, viz. 23 rows on the body and 27 on the neck; from the latter in the absence of a subocular separating the fourth labial from the eye, the deeper rostral,

which is but little broader than deep, and the shorter posterior chin-shields, which are not or but slightly longer than the anterior. Ventrals 239-243; anal entire; subcaudals 107-108. Brown above, darker along the back, uniform or with black spots disposed in longitudinal series on the anterior part of the body; a short dark streak behind the eye; lower parts yellowish, spotted with pale brown posteriorly.

Total length 1420 millim.; tail 310.

Engano Island, S.W. Sumatra.

39. *Coluber subradiatus*.

Coluber subradiatus, *Schleg. Phys. Serp.* ii. p. 136 (1837), and *Abbild.* p. 101, pls. xxviii. figs. 7 & 8, and pl. xxix. (1840).

— *nyctenurus*, *Jan, Elenco*, p. 61 (1863).

— *subradiatus*, *Van Lidth de Jeude, in M. Weber, Zool. Ergebn.* p. 184 (1890).

Nearly allied to *C. radiatus*, but differing in the following points:—Rostral much broader than deep; a subocular below the ocular; fifth and sixth labials entering the eye; anterior chin-shields much shorter than the posterior; scales in 23 or 25 rows (25 or 27 on the neck). Ventrals 228-242; anal entire; subcaudals 80-100. Pale reddish brown above, with a pair of black stripes along each side of the anterior half of the body; these stripes may be broken up into series of spots; a short black streak behind the eye; lower parts uniform yellowish.

Total length 1250 millim.; tail 260.

Pituophis lineaticollis, *Günth. Biol. C.-Am., Rept.* p. 124, pl. xlvii. (1894).

Rostral broader than deep, visible from above; internasals broader than long, shorter than the præfrontals; frontal once and a half as long as broad, as long as its distance from the rostral, a little shorter than the parietals; loreal a little longer than deep; one (or two) præ- and three postoculars; temporals 2+3 or 4; eight or nine upper labials, fourth and fifth, or fourth, fifth, and sixth, entering the eye; four or five lower labials in contact with the anterior chin-shields. Scales in 27 rows, dorsals strongly keeled. Ventrals 244; anal entire; subcaudals 69. Pale brown above; head uniform;

neck with four interrupted black stripes; a dorsal series of ∞ -shaped black markings, and a series of smaller markings on each side; lower parts yellow, posteriorly with squarish black blotches.

Total length 1500 millim.; tail 230.

Schreib. Herp. Eur. p. 290 (1875); *Bedriaga, Amph. & Rept. Portug.* p. 73 (1889).

Snout strongly projecting; rostral deeper than broad, forming an acute angle posteriorly, wedged in between the internasals, the portion visible from above nearly as long as its distance from the frontal; internasals shorter than the prefrontals; frontal about once and one third as long as broad, as long as or shorter than its distance from the end of the snout, nearly as long as the parietals; loreal longer than deep; one præ- and two or three postoculars; temporals 2+3 or 2+4; seven or eight upper labials, fourth or fourth and fifth entering the eye; four or five lower labials in contact with the anterior chin-shields, which may be either longer or shorter than the posterior. Scales smooth, in 27 (rarely 25 or 29) rows. Ventrals 201–220; anal divided (rarely entire); subcaudals 48–68. Young yellowish or pale brown above, with a series of regular H-shaped black or blackish-brown markings along the back, and small black spots on the sides; a V-shaped black marking on the snout, a black streak from the eye to the angle of the mouth, and a black spot below the eye; belly yellow, spotted or checkered with black, or nearly entirely black. These dorsal markings disappearing in the adult, and replaced by a pair of brown stripes running along the back; the belly uniform yellow.

Total length 925 millim.; tail 160.

61. SYNCHALINUS.

Synchalinus, Cope, *Proc. Amer. Philos. Soc.* xxxi. 1893, p. 345.

Teeth equal. Head distinct from neck; eye large, with round pupil; nasals and loreal fused into a single elongate shield. Body elongate, compressed; scales smooth or faintly keeled, with apical pits, in 23 rows; ventrals sharply angulate laterally. Tail long; subcaudals in two rows.

Central America.

1. *Synchalinus corallioides*.

Synchalinus corallioides, Cope, *l. c.*

Similar in general appearance to *Corallus hortulanus*. Snout subtruncate; rostral slightly visible from above; internasals subquadrate; præfrontals wider than long; frontal shorter than supraocular, with concave lateral borders; parietals as broad as long; nasal in contact with the single præocular; two postoculars; temporals 2 + 2; eight upper labials, fourth, fifth, and sixth entering the eye, last very long; posterior chin-shields longer than the anterior. Scales in 23 rows, three or four median rows faintly keeled. Ventrals 209; anal entire; subcaudals 134. Yellowish brown above, with a dorsal series of parallelogrammic spots of an iron-rust colour, each of which has a small blackish spot at its anterior extremity; sides with wide vertical spots of the colour of the dorsals, with which some may be confluent, forming with them broad cross bands; a dark brown band from the eye to the side of the neck; three dark bars below the eye; a dark marking on the vertex; belly dark mahogany on the middle line; a dark spot on the outer ends of the ventrals, opposite to the lateral vertical bars.

Total length 450 millim.; tail 125.

Buenos Ayres, Costa Rica.

62. GONYOPHIS.

Gonyophis, Bouleng. *Ann. & Mag. N. II.* (6) viii. 1891, p. 290.

Maxillary teeth 23, equal; mandibular teeth subequal. Head distinct from neck, elongate; eye moderate, with round pupil. Body elongate, compressed; scales feebly keeled, with apical pits, in 19 rows; ventrals with a suture-like lateral keel, and a notch on each side corresponding to the keel. Tail long; subcaudals in two rows, keeled and notched like the ventrals.

Malay Peninsula and Borneo.

1. *Gonyophis margaritatus*.

Gonyosoma margaritatum, *Peters, Mon. Berl. Ac.* 1871, p. 578, a
Ann. Mus. Genova, iii. 1872, p. 39, pl. v. fig. 3.

 p. 290; *Werner, Verh. zool.-bot. Ges. Wien*, 1893, p. 357.

Rostral broader than deep, just visible from above; internasals as long as broad, shorter than the præfrontals; frontal a little longer than broad, as long as its distance from the end of the snout, shorter than the parietals; loreal longer than deep; one præocular, not in contact with the frontal, or just touching; two postoculars; temporals 2+2; nine upper labials, fourth, fifth, and sixth, or fifth and sixth, entering the eye; four or five lower labials in contact with the anterior chin-shields, which are as long as the posterior. Scales in 19 rows, feebly keeled. Ventrals 230-241; anal divided; subcaudals 108-120. Black above, each scale with a yellowish-green spot, or green with black borders to the scales; hinder part of body and tail with bright orange rings; lower parts yellowish, the shields with or without a black edge; a black streak on each side of the head behind the eye, and another along the suture between the parietals.

Total length 1530 millim.; tail 370.

Borneo, Singapore.

a. Yg. (V. 233; C. 108). Mt. Dulit, Borneo. C. Hose, Esq. [C.].

Eye very large. Rostral broader than deep, visible from above; internasals as long as or slightly shorter than the præfrontals; frontal once and one fourth to once and two thirds as long as broad, as long as or a little shorter than its distance from the end of the snout or the parietals; loreal longer than deep; one præ- and two (rarely three) postoculars; temporals 1+1 or 1+2; eight or nine upper labials, fourth and fifth, fifth and sixth, or fourth, fifth, and sixth, entering the eye; five or six lower labials in contact with the anterior chin-shields, which are as long as or shorter than the posterior. Scales in 12 rows, all smooth, or the two middle rows faintly keeled (females), or the two middle rows more or less strongly keeled (males). Ventrals feebly angulate laterally, 145-173; anal divided (very rarely entire); subcaudals 110-171.

Total length 1530 millim.; tail 500.

Central America; South America east of the Andes and north of the Rio de la Plata; Lesser West Indies (Trinidad, Guadeloupe, St. Vincent).

- A. Dark brown or blackish above; the vertebral line pale brown; a series of large yellowish spots along each side of the body on the outer series of scales; ventral and subcaudal shields yellow, with a fine black edge. Temporals 1 + 2; two labials entering the eye. (*C. carinatus*, L.)

— *carinatus*, Cope, *l. c.*

Eye rather large. Rostral broader than deep, just visible from above; internasals as long as the præfrontals; frontal once and a half as long as broad, as long as its distance from the end of the snout, a little shorter than the parietals; loreal as long as deep or a little longer; one præ- and two postoculars; temporals 2+2; nine upper labials, fourth, fifth, and sixth entering the eye; five lower labials in contact with the anterior chin-shields, which are a little shorter than the posterior. Scales in 10 longitudinal rows,

about as large as the parietal shields, all except the outer row keeled; the keels on the two median rows stronger. Ventrals 157-162; anal divided; subcaudals 118-135. Black, the throat and anterior part of the belly yellow.

Total length 2200 millim.; tail 500.

Costa Rica.

64. DENDROPHIS.

Ahaetulla, part., Gray, *Ann. Phil.* x. 1825, p. 203.

Maxillary teeth 20 to 33, the posterior more or less enlarged, stouter if not longer than the rest; anterior mandibular teeth longest. Head distinct from neck, more or less elongate; eye large, with round pupil. Body elongate, more or less compressed; scales smooth, in 13 or 15 rows, narrow, disposed obliquely, with apical pits, those of the vertebral row more or less enlarged; ventrals with a suture-like lateral keel and a notch on each side, corresponding to the keel. Tail long; subcaudals in two rows, keeled and notched like the ventrals.

South-eastern Asia and Australia.

Fig. 6.

Maxillary and mandible of *Dendrophis pictus*.

Synopsis of the Species.

I. Maxillary teeth 20 to 26; eye not longer than its distance from the nostril.

A. Scales in 15 rows.

A single loreal; ventrals 165-190 1. *pictus*, p. 78.

Two loreals; ventrals 154-171 2. *bifrenalis*, p. 80.

B. Scales in 13 rows.

Usually two superposed anterior temporals; ventrals 176-211 3. *calligaster*, p. 80.

Usually a single, much elongate anterior temporal; ventrals 191-220; no dark streak on the side of the head 4. *punctulatus*, p. 82.

II. Maxillary teeth 27 to 33; eye usually longer than its distance from the nostril.

A. Scales in 15 rows.

Two postoculars; vertebral scales scarcely enlarged on the anterior part of the body; ventrals 174-188 5. *grandoculis*, p. 84.

Usually three postoculars; vertebral scales very strongly enlarged; ventrals 179-205 6. *formosus*, p. 84.

B. Scales in 13 rows.

Two postoculars; ventrals 149-161; subcaudals 124-128 7. *caudolineolatus*, p. 85.

Two postoculars; ventrals 173-203; subcaudals 131-151 8. *lineolatus*, p. 85.

Three postoculars; ventrals 162; subcaudals 148 9. *gastrostictus*, p. 86.

Leptophis formosus, Jan, Icon. Gén. 49, pl. vi. fig. 2 (1879).

Maxillary teeth 23 to 26. Eye as long as its distance from the nostril. Rostral much broader than deep, visible from above; internasals as long as or a little shorter than the præfrontals; frontal once and one third to once and two thirds as long as broad, as long as its distance from the rostral or the end of the snout, shorter than the parietals; loreal elongate (in one specimen divided into two, in another fused with the præfrontal); one præ- and two postoculars; temporals 2+2, rarely 1+1 or 1+2; nine

upper labials, fifth and sixth, or fourth, fifth, and sixth, entering the eye, rarely seven or eight; five, rarely four, lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 15 rows, vertebrals nearly as large as outer; the enlarged vertebral scales originating abruptly a short distance behind the head, by fusion of two nuchal scales. Ventrals 165-190; anal divided; subcaudals 122-164. Olive or bronze-brown above; a black stripe on each side of the head, passing through the eye, usually very strongly marked on the temple and extending to the nape, where it may widen or break up into spots; a yellow lateral stripe, bordered below by a dark, usually black line or stripe along the limit between the lower row of scales and the ventral shields; upper lip yellow; lower parts uniform pale yellow or greenish.

Total length 1180 millim.; tail 440.

— *darnleyensis*, *Macleay, l. c.* p. 38.

— *punctulatus*, part., *Peters & Doria, Ann. Mus. Genova*, xiii. 1878, p. 390.

Maxillary teeth 20 to 26. Eye not longer than its distance from the posterior border of the nostril. Rostral once and two thirds to twice as broad as deep, visible from above; internasals as long as or a little longer than the præfrontals; frontal once and one third to once and three fourths as long as broad, as long as its distance from the rostral or the tip of the snout, usually shorter than the parietals; loreal once and a half to thrice as long as deep (rarely absent, fused with the præfrontal); one præ- and two (rarely three) postoculars; temporals usually 2+2, sometimes 1+2; eight or nine upper labials, fourth and fifth or fifth and sixth entering the eye; five (rarely four) lower labials in contact with

the anterior chin-shields, which are much shorter than the posterior. Scales in 13 rows, the vertebrales about as large as the outer. Ventrals 176-211; anal divided; subcaudals 125-151. Coloration very variable, but a more or less distinct black or blackish streak on each side of the head, passing through the eye, is constant, and usually connected with its fellow across the rostral shield; upper lip and throat yellow; some of the scales with more or less distinct yellowish outer border.

Total length 1270 millim.; tail 430.

Moluccas, New Guinea and neighbouring Islands, Solomon Islands, Cape York.

A. Bronzy or olive above; the dark streak on the side of the head usually prolonged to the neck, where it may break up into spots; pale olive beneath, more or less closely speckled with darker. (*D. calligaster*, Gthr.; *D. aruensis*, Doria; *D. darnleyensis*, Macleay.)

<i>a-b</i> . ♀ (V. 194, 191; C. 141, 150).	Mansinam, New Guinea.	M. L. Laglaize [C.].
<i>c-e</i> . ♂ (V. 178; C. 128) & ♀ (V. 184, 185; C. 132, 135).	Islands of Torres Straits.	Rev. S. Macfarlane [C.].

 — *olivacea*, *Macleay, Proc. Linn. Soc. N. S. W.* ii. 1878, p. 220.

Maxillary teeth 24 to 26. Eye not longer than its distance from the posterior border of the nostril. Rostral once and a half to once and two thirds as broad as deep, visible from above; internasals nearly as long as or a little longer than the præfrontals; frontal once and one fourth to once and a half as long as broad, as long as or a little longer than its distance from the end of the snout, shorter than the parietals; loreal once and a half to twice and a half as long as deep; one præ- and two postoculars; temporals usually 1+2, rarely 2+2, or 1+1, anterior very long; seven or eight (rarely nine) upper labials, fourth and fifth (rarely fifth and sixth) entering the eye; five lower labials in contact with the anterior chin-shields, which are much shorter than the posterior. Scales in 13 rows, the ventrals about as large as the outer. Ventrals 191–220; anal divided; subcaudals 120–144. Brown or olive above, uniform or with black edges to the scales; usually some of the scales with a yellowish outer border; no black stripe on the side of the head; upper lip, throat, and anterior ventrals yellowish.

Total length 1640 millim.; tail 440.

Northern and Eastern Australia.

A. Ventrals and subcaudals pale olive or brownish, with the keels yellowish, but unspotted.

B. Dark olive above, each scale partly black; posterior ventrals marbled with black, or black in the middle with the posterior border and the sides above the keels yellowish white; subcaudals black, with two yellowish lines following the keels. (*D. gracilis*, *Macleay*.)

- a. ♀ (V. 202; C. 127). Queensland.

5. *Dendrophis grandoculis*. (PLATE IV. fig. 2.)

Dendrophis grandoculis, *Bouleng. Faun. Ind., Rept.* p. 337 (1890).

Maxillary teeth 30 to 32. Eye extremely large, as long as its distance from the rostral or the anterior border of the nostril. Rostral much broader than deep, just visible from above; internasals as long as or a little longer than the præfrontals; frontal once and a half to once and two thirds as long as broad, as long as its distance from the end of the snout, as long as the parietals; loreal elongate; one præ- and two postoculars; temporals 2+2 or 1+2; nine upper labials, fourth, fifth and sixth entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 15 rows, vertebrals not quite as large as the outer, scarcely enlarged on the anterior part of the body. Ventrals 174-188; anal divided; subcaudals 117-124. Brown or olive-brown above, with irregular small black blotches; eye bordered with whitish; no lateral stripes; sides of neck sometimes tinged with vermilion; lower parts pale olive, with or without small black spots on the sides; three black lines along the tail, one on each side and one below.

Total length 1200 millim.; tail 370.

Maxillary teeth 28 to 31. Eye very large, as long as its distance from the rostral or the anterior border of the nostril. Rostral twice as broad as deep, just visible from above; internasals a little longer than the præfrontals; frontal once and one third to once and a half as long as broad, as long as its distance from the end of the snout, as long as the parietals; loreal elongate; one præ- and two to four (usually three) postoculars; temporals 2+2; nine upper labials (rarely eight), fifth and sixth or fourth, fifth, and sixth (or third, fourth, and fifth) entering the eye; five lower labials in contact with the anterior chin-shields, which are much shorter than the posterior. Scales in 15 rows, vertebrals strongly enlarged, considerably larger than the outer, originating abruptly on the nape by fusion of the two median scales. Ventrals 179-205; anal divided; subcaudals 132-158. Olive above, scales black-edged; a black stripe on each side of the head, passing through the eye and extending on

to the nape, where it considerably widens; no light lateral stripe; two black lines may be present along each side of the posterior part of the body; upper lip greenish yellow; lower parts pale green.

Total length 1310 millim.; tail 450.

Eye as long as its distance from the anterior border of the nostril. Rostral a little broader than deep, visible from above; internasals nearly as long as the præfrontals; frontal once and two thirds as long as broad, longer than its distance from the end of the snout, a little shorter than the parietals; loreal elongate; one præ- and two postoculars; temporals 2+2; eight upper labials, fifth largest and bordering the eye; five lower labials in contact with the anterior chin-shields, which are much longer than the posterior. Scales in 15 rows. Ventrals 167–172; anal divided; subcaudals 74–105. Olive-brown above, upper lip and a lateral streak yellowish white; an olive-brown stripe between the lateral yellowish streak and the yellowish ventrals, occupying the extremities of the latter shields and the lower half of the outer scales; a black line behind the eye, above the labials; anterior labials with black lines on the sutures; a rather indistinct pale greenish line along the nape, bordered on each side, in the young, by a series of large round black spots.

Total length 820 millim.; tail 220.

Upper Burma.

Herpetæthiops, *Günth. Ann. & Mag. N. H.* (3) xviii. 1866, p. 27.

Fig. 8.

Maxillary and mandible of *Chlorophis natalensis*.

* A snake figured, but not described, by Jan, as from Mozambique, *Dendrophis subcarinatus*, *Icon. Gén.* 32, pl. ii. fig. 2 (1863), perhaps belongs to this genus, but has feebly-keeled dorsal scales and the dentition is represented as isodont.

Maxillary teeth 20 to 25, posterior longest; mandibular teeth subequal. Head more or less elongate, distinct from neck; eye large or rather large, with round pupil. Body cylindrical; scales smooth, with apical pits, in 15 rows, disposed obliquely, at least on the anterior part of the body; ventrals rounded or more or less distinctly keeled on each side, the keel not extending to the subcaudals. Tail long or rather long; subcaudals in two rows.

Tropical and South Africa.

Synopsis of the Species.

I. No trace of ventral keels.

- Three labials (fourth, fifth, and sixth)
entering the eye; subcaudals 111-122. 1. *emini*, p. 92.
Three labials (third, fourth, and fifth)
entering the eye; subcaudals 85-99. 2. *ornatus*, p. 93.
Two labials entering the eye; subcaudals
85-105 3. *hoplogaster*, p. 93.

II. Ventrals more or less distinctly keeled on the sides.

A. Anal divided (rarely entire).

1. Two labials entering the eye.

- Fourth and fifth labials entering the eye;
a single anterior temporal; subcaudals
77-114 4. *neglectus*, p. 94.
Fourth and fifth labials entering the eye;
usually two superposed anterior tem-
porals; subcaudals 114-124. 5. *natalensis*, p. 94.
Fifth and sixth labials entering the eye;
subcaudals 90-100 6. *angolensis*, p. 95.

2. Three labials entering the eye.

- Ventrals 175-190; subcaudals 115-135;
temporals 1+1; body very slender
anteriorly 7. *heterolepidotus*, p. 95.
Ventrals 150-182; subcaudals 94-133;
temporals usually 1+2. 8. *irregularis*, p. 96.

- B. Anal entire; subcaudals 78-92; three labials entering the
eye 9. *heterodermus*, p. 97.

1. *Chlorophis emini*. (PLATE V. fig. 1.)

Ahætulla irregularis, part., *Günth. Ann. & Mag. N. H.* (3) xi. 1863,
p. 285.
— *emini*, *Günth. Ann. & Mag. N. H.* (6) i. 1888, p. 325.

Rostral a little broader than deep, the portion visible from above measuring one third its distance from the frontal; internasals a little shorter than the præfrontals; frontal once and a half to once and two thirds as long as broad, a little longer than its distance from the end of the snout, a little shorter than the parietals; loreal

nearly twice as long as deep; one præocular, usually not touching the frontal; two postoculars; temporals 1+2 or 1+1; nine upper labials, fourth, fifth, and sixth entering the eye; five lower labials in contact with the anterior chin-shields, which are a little shorter than the posterior. Scales in 15 rows. Ventrals rounded, 155-190; anal divided; subcaudals 111-122. Green above, the interstitial skin black; some of the scales with a white spot on the basal half of the outer margin.

Total length 720 millim.; tail 250.

Eastern Central Africa.

a. ♂ (V. 155; C. 111). Monbuttu.

Dr. Emin Pasha [P.].

(Type.)

b-c. Yg. (V. 190, 183; C. 500 miles south of Consul J. Petherick [C.].

2. *Chlorophis ornatus*.

Philothamnus ornatus, Bocage, *Journ. Sc. Lisb.* ii. 1872, p. 80, & ix. 1882, p. 15, fig.

Internasals shorter than the præfrontals; frontal with straight lateral borders, once and a half as long as broad, shorter than the parietals; loreal longer than deep; one præocular, in contact with the frontal; two postoculars; temporals 1+1; eight upper labials, third, fourth, and fifth entering the eye. Scales in 15 rows. Ventrals rounded, 152-166; anal divided; subcaudals 85-99. Bronzy green above, with a brown vertebral stripe edged with yellowish; yellowish or pale green beneath.

Total length 710 millim.; tail 200.

Guinea; Angola.

3. *Chlorophis hoplogaster*. (PLATE V. fig. 2.)

Ahætulla hoplogaster, Günth. *Ann. & Mag. N. H.* (3) xi. 1863, p. 284; *Bouleng. Faun. Ind., Rept.* p. 305 (1890).

Chlorophis oldhami, Theob. *Cat. Rept. As. Soc. Mus.* p. 49 (1868).

Cyclophis oldhami, Theob. *Cat. Rept. Brit. Ind.* p. 159 (1876).

Philothamnus hoplogaster, Bocage, *Journ. Sc. Lisb.* ix. 1882, p. 17.

Rostral broader than deep, the portion visible from above measuring one third to two fifths its distance from the frontal; internasals as long as or a little shorter than the præfrontals; frontal once and a half as long as broad, as long as its distance from the end of the snout, a little shorter than the parietals; loreal once and two thirds to twice as long as deep; one præocular, not touching the frontal; two postoculars; temporals 1+1 or 1+2; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 15 rows. Ventrals rounded, without trace of a keel, 150-169; anal divided; subcaudals 85-105. Uniform green or olive above, greenish yellow inferiorly.

Total length 700 millim.; tail 220.

Central and South Africa.

9. *Chlorophis heterodermus*.

Chlorophis heterodermus, *Hallow. Proc. Ac. Philad.* 1857, p. 54.

Ahetulla heteroderma, *Günth. Ann. & Mag. N. H.* (3) xi. 1863, p. 285.

Herpetæthiops bellii, *Günth. Ann. & Mag. N. H.* (3) xviii. 1866, p. 27, pl. vii. fig. B.

Philothamnus heterodermus, *Buchh. & Peters, Mon. Berl. Ac.* 1875, p. 199; *Bocage, Journ. Sc. Lisb.* ix. 1882, p. 18; *Boettg. Ber. Senck. Ges.* 1883, p. 59.

Rostral broader than deep, the portion visible from above measuring hardly one fourth its distance from the frontal; internasals as long as or a little shorter than the præfrontals; frontal with slightly concave lateral borders, as long as or a little longer than its distance from the end of the snout, as long as the parietals; loreal once and a half to twice as long as deep; one præocular, usually not in contact with the frontal; two postoculars; temporals 2+2; nine upper labials, fourth, fifth, and sixth entering the eye; five lower labials in contact with the anterior chin-shields, which are as long as the posterior. Scales in 15 rows. Ventrals with moderately

strong lateral keel, 148-162; anal entire; subcaudals 78-92. Green or olive above, the skin between the scales black; young with black cross bars; lower parts greenish yellow. Specimens *a* and *c* black above, blackish olive beneath.

Total length 740 millim.; tail 200.

West Africa, from Sierra Leone to the Congo.

71. LEPTOPHIS.

Leptophis, part., *Bell, Zool. Journ.* ii. 1825, p. 328; *Dum. & Bibr.*

Erp. Gén. vii. p. 528 (1854); *Jan, Elenco sist. Ofid.* p. 84 (1863);

Cope, Journ. Ac. Philad. (2) viii. 1876, p. 132.

Leptophis, *Wagl. Syst. Amph.* p. 183 (1830).

Ahetula, part., *Gray, Griff. A. K.* ix. *Syn.* p. 93 (1831); *Günth.*

Cat. Col. Sn. p. 151 (1858).

Dendrophis, part., *Schleg. Phys. Serp.* ii. p. 220 (1837).

Thrasops, part., *Cope, Proc. Ac. Philad.* 1860, p. 556.

Diplotropsis, *Günth. Ann. & Mag. N. H.* (4) ix. 1872, p. 24.

Maxillary teeth 20 to 32, posterior longest; anterior mandibular teeth longest. Head elongate, distinct from neck; eye large, with round pupil. Body slender, cylindrical or slightly compressed; scales keeled or smooth, with apical pits, in 13 or 15 rows, disposed

obliquely, at least on the anterior portion of the body; ventrals rounded or angulate laterally. Tail long; subcaudals in two rows.
Central and South America.

Fig. 10.

Maxillary and mandible of *Leptophis liocercus*.

Synopsis of the Species.

I. Loreal present (rarely absent).

A. Scales smooth.

- | | |
|--|--------------------------------|
| Nasals not elongate; loreal subquadrate .. | 1. <i>æruginosus</i> , p. 107. |
| Nasals elongate; loreal thrice as long as deep | [p. 107.] |
| | 2. <i>depressirostris</i> , |

B. Scales keeled, except the outer row.

- | | |
|--|-------------------------------|
| Loreal once and a half as long as deep;
ventrals without trace of lateral keel .. | 3. <i>modestus</i> , p. 107. |
| Loreal twice to thrice as long as deep;
ventrals feebly angulate laterally | 4. <i>mexicanus</i> , p. 108. |

C. Five median rows of scales feebly keeled.

5. *cupreus*, p. 109.

D. Only the scales of the series on each side of the vertebral keeled.

- | | |
|---|---------------------------------|
| Ventrals not angulate, 160 | 6. <i>saturatus</i> , p. 110. |
| Ventrals feebly angulate laterally, 175-186 | 7. <i>diplotropis</i> , p. 110. |
| Ventrals feebly angulate laterally, 144.... | 8. <i>bilineatus</i> , p. 111. |

II. Loreal absent.

A. Scales in 15 rows, keeled; ventrals more or less distinctly angulate laterally.

- | | |
|---|----------------------------------|
| Scales of vertebral row more feebly keeled
than the one or two on each side of it;
frontal not more than once and a half as
long as broad | 9. <i>occidentalis</i> , p. 111. |
| Scales more or less distinctly keeled, the
keel on the middle row more feeble, or
obsolete; frontal at least once and a half
as long as broad..... | [p. 112.] |
| | 10. <i>nigromarginatus</i> , |

Scales all except the outer row strongly

keeled..... 11. *liocercus*, p. 113.

B. Scales in 15 rows, smooth; ventrals not angulate laterally.

12. *ortonii*, p. 114.

C. Scales in 13 rows, all except the outer row keeled.

13. *urostictus*, p. 114.

1. *Leptophis æruginosus*.

Leptophis æruginosus, Cope, *Journ. Ac. Philad.* (2) viii. 1876, p. 132; *Günth. Biol. C.-Am., Rept.* p. 130 (1894).

Philothamnus æruginosus, Cope, *Proc. Amer. Philos. Soc.* xxiii. 1886, p. 279.

Nasal not elongate; loreal present, subquadrate; præocular scarcely reaching frontal; two postoculars; temporals 1+2; nine upper labials, fifth and sixth entering the eye; posterior chin-shields longer than the anterior. Scales in 15 rows, not keeled, but finely striate. Ventrals faintly angulate laterally, 146; anal divided; subcaudals 142. Golden brown above; vertebral line (one row of scales) yellow on the anterior half of the body; a black streak on each side of the head behind the eye; beneath blue, fading to yellowish on the gular region.

Total length 405 millim.; tail 155.

Costa Rica.

2. *Leptophis depressirostris*.

Philothamnus depressirostris, Cope, *Proc. Ac. Philad.* 1860, p. 557.

Leptophis depressirostris, *Günth. Biol. C.-Am., Rept.* p. 130 (1894).

Rostral twice as broad as deep; frontal as long as the parietals; nasals elongate; loreal present, thrice as long as deep; one præ- and two postoculars; nine upper labials, fifth and sixth entering the eye. Scales smooth, in 15 rows. Above uniform deep green; an inconspicuous temporal streak; a very delicate black line traverses the centre of each of the two rows of scales that bound the vertebral row: upper lip and lower parts light green.

Total length 650 millim.

Cocuyas de Veraguas, Colombia.

3. *Leptophis modestus*.

Ahætulla modesta, *Günth. Ann. & Mag. N. H.* (4) ix. 1872, p. 26, pl. vi. fig. C.

Philothamnus modestus, Cope, *Proc. Amer. Philos. Soc.* xxiii. 1886, p. 279.

Leptophis modestus, *Günth. Biol. C.-Am., Rept.* p. 129, pl. xlviii. (1894).

Eye a little shorter than its distance from the nostril. Rostral broader than deep, just visible from above; internasals shorter than

the præfrontals; frontal once and one third as long as broad, as long as its distance from the rostral, shorter than the parietals; nasal elongate, divided; loreal present, once and a half as long as deep; one præocular, not reaching the frontal; two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 15 rows, all except the outer strongly keeled; caudal scales smooth, except the basal ones. Ventrals without trace of lateral keel, 171; anal divided; subcaudals 171. Uniform olive-green above, pale green beneath; lips and throat yellowish; a blackish streak on each side of the head, behind the eye.

Total length 1300 millim.; tail 540.

Guatemala.

- a. ♂ (V. 171; C. 171). Rio Chisoy, below the town of Cubulco. O. Salvin, Esq. [P.] (Type.)

4. *Leptophis mexicanus*.

Leptophis mexicanus, Dum. & Bibr. vii. p. 536 (1854); Jan, *Icon. Gén.* 49, pl. vi. fig. 3 (1879).

Ahaetulla mexicana, Günth. *Cat.* p. 154 (1858).

Thrasops mexicanus, Cope, *Proc. Ac. Philad.* 1860, p. 557.

Hapsidophrys mexicanus, Cope, *Proc. Am. Philos. Soc.* xxii. 1885, p. 382.

Rostral broader than deep, just visible from above; internasals as long as or a little shorter than the præfrontals; frontal once and one third to once and two thirds as long as broad, as long as its distance from the end of the snout, a little shorter than the parietals; nasal elongate, divided; loreal present, twice to thrice as long as deep; one præocular, not reaching the frontal; two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; four or five (rarely six) lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 15 rows, striated, all except the outer row strongly keeled; caudal scales keeled. Ventrals feebly angulate laterally, 154-174; anal divided; subcaudals 141-172.

Total length 1340 millim.; tail 520.

Northern Mexico to Costa Rica.

- A. Pale bronzy brown or golden above, head blue or green; a black lateral stripe on the head and body, passing through the eye, enclosing some bluish-green spots in the anterior half of the body; upper lip and lower parts mother-of-pearl or pale golden.

- a. Hgr. (V. 166; C. 162). Amula, Guerrero. Mr. H. H. Smith [C.]; F. D. Godman, Esq. [P.]
b. Hgr. (V. 164; C. 156). Teapa, Tabasco. F. D. Godman, Esq. [P.]

5. *Leptophis cupreus*.

Thrasops cupreus, Cope, *Proc. Ac. Philad.* 1868, p. 106.

Head unusually short and broad. Rostral much broader than deep, little visible from above; nasal long and narrow; loreal present, absent on one side in the type specimen; one pre- and two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye. Scales in 15 rows, the five median feebly keeled. Ventrals 152; anal divided; subcaudals 136. Above metallic copper colour; a dark streak on the side of the head,

passing through the eye; labials and chin yellowish white; ventrals brown, copper-coloured, with darker dashes.

Total length 520 millim.; tail 205.

Upper Amazon.

6. *Leptophis saturatus*.

Leptophis saturatus, Cope, *Journ. Ac. Philad.* (2) viii. 1876, p. 133.

Hapsidophrys saturatus, Cope, *Proc. Amer. Philos. Soc.* xxiii. 1886, p. 279.

Head short and wide; snout not longer than the diameter of the eye. Frontal rather broad; nasals not elongate; loreal present, nearly twice as long as deep; one præocular, nearly reaching the frontal; two postoculars; temporals 1+2; nine upper labials, fifth and sixth entering the eye. Scales in 15 rows, one on each side of the median vertebral weakly keeled. Ventrals not angulate, 160; anal divided; subcaudals 133. Indigo-blue (in spirits), very dark on head and spine; lips dark green; a blackish shade above the labials behind the eye.

Total length 880 millim.; tail 340.

Sipurio, Costa Rica.

7. *Leptophis diplotropis*.

Ahætulla diplotropis, Günth. *Ann. & Mag. N. H.* (4) ix. 1872, p. 25, pl. vi. fig. A.

Hapsidophrys diplotropis, Cope, *Proc. Amer. Philos. Soc.* xxiii. 1886, p. 279.

Leptophis diplotropis, Günth. *Biol. C.-Am., Rept.* p. 130 (1894).

Rostral broader than deep, just visible from above; internasals shorter than the præfrontals; frontal once and a half to once and two thirds as long as broad, as long as its distance from the end of the snout, shorter than the parietals; nasal elongate, divided; loreal usually present, once and a half to thrice as long as deep; one præocular, not reaching the frontal; two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 15 rows, those of the series on each side of the vertebral with a strong keel. Ventrals feebly angulate laterally, 165-186; anal divided; subcaudals 126-166. Olive or pale green above, with or without oblique black cross bars; scales of the vertebral series yellowish or pale olive; a black stripe on each side of the head and neck, passing through the eye; two black lines following the dorsal keels; upper lip and lower parts pale greenish yellow.

Total length 1250 millim.; tail 440.

Western Mexico.

8. *Leptophis bilineatus*.

Diploptropis bilineata, *Günth. Ann. & Mag. N. H.* (4) ix. 1872, p. 24, pl. vi. fig. B.

Leptophis bilineatus, *Cope, Proc. Amer. Philos. Soc.* xxiii. p. 279; *Günth. Biol. C.-Am., Rept.* p. 130 (1894).

Rostral broader than deep, just visible from above; internasals as long as the præfrontals; frontal once and a half as long as broad, as long as its distance from the end of the snout, as long as the parietals; nasal moderately elongate, divided; loreal present, twice as long as deep; one præocular, not quite reaching the frontal; two postoculars; temporals 1+2; eight or nine upper labials, fourth and fifth (or fifth and sixth) entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 15 rows, those of the series on each side of the vertebral with a strong keel. Ventrals feebly angulate laterally, 144; anal divided. Bright green above, light greenish beneath; two black lines following the dorsal keels; a very indistinct dark streak on each side of the head, passing through the eye.

Total length 910 millim.

Costa Rica, Nicaragua, Tehuantepec.

— *occidentalis*, *Cope, Proc. Amer. Philos. Soc.* xxiii. 1880, p. 279.

Rostral broader than deep, just visible from above; internasals shorter than the præfrontals; frontal once and one fourth to once and a half as long as broad, as long as its distance from the rostral or the end of the snout, as long as or a little shorter than the parietals; nasal elongate, divided; no loreal; præfrontal in contact with the second and third, or second, third, and fourth labials; one præocular, in contact with or not quite reaching the frontal; two or three postoculars: temporals 1+2; eight or nine upper labials, fourth and fifth or fifth and sixth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are much shorter than the posterior. Scales in 15 rows, all except the outer row more or less distinctly keeled; scales of middle row more feebly keeled than the one or two on each side of it; scales on the neck and tail smooth. Ventrals 152-185, feebly angulate laterally; anal divided; subcaudals 133-176.

Total length 2000 millim.; tail 730.

Central America, Colombia, Ecuador, Peru.

A. Green above, the keels brown or black; yellowish or pale green beneath; a black streak on each side of the head behind the eye, disappearing in old specimens.

Leptophis marginatus, Cope, *Journ. Ac. Philad.* (2) viii. 1876, p. 177.

Rostral broader than deep, just visible from above; internasals as long as or a little shorter than the præfrontals; frontal once and a half to once and three fourths as long as broad, as long as its distance from the end of the snout, as long as or slightly shorter than the parietals; nasal elongate, entire or divided; no loreal;

præfrontal in contact with labials; one præocular, in contact with or narrowly separated from the frontal; temporals 1+2; eight or nine upper labials, fourth and fifth or fifth and sixth entering the eye; five or six lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 15 rows, all except the outer row more or less distinctly keeled; the keel on the middle vertebral series more feeble, or obsolete; scales on neck and tail smooth. Ventrals distinctly angulate laterally, 149-161; anal divided; subcaudals 106-163. Green above, head-shields and scales broadly edged with black; keels black; ventrals and subcaudals yellowish or pale green, uniform or edged with dark green.

Total length 1010 millim.; tail 390.

12. *Leptophis ortonii*.

Leptophis ortonii, Cope, *Journ. Ac. Philad.* (2) viii. 1876, p. 177.

Nearly allied to *L. nigromarginatus*, but scales smooth and ventrals non-angulate. Blue above; a coppery golden spot within the apex of many of the scales, which extends on those of the external two rows so as to cover the scale except at its base; ventrals coppery golden, the front margin sea-green; the blue scales have a black tip, and often a narrow border; head uniform green; labials yellow, with a narrow black line along the upper margin of the posterior ones.

Total length 965 millim.; tail 390.

Middle Amazon, Peru.

13. *Leptophis urostictus*.

Ahætulla urosticta, Peters, *Mon. Berl. Ac.* 1873, p. 606.

No loreal; nine upper labials. Scales in 13 rows, all except the

outer keeled; smooth on the tail. Ventrals 163. Olive-green above, the keels black; vertebral scales dotted with black on the sides; a black streak on each side of the head, behind the eye; pale green beneath.

Bogota.

72. UROMACER.

Dendrophis, part., *Schleg. Phys. Serp.* ii. p. 220 (1837).

Uromacer, *Dum. & Bibr. Mém. Ac. Sc.* xxiii. 1853, p. 478, and *Erp.*

Gén. vii. p. 719 (1854); *Jan, Elenco sist. Ofid.* p. 87 (1863).

Ahætulla, part., *Günth. Cat. Col. Sn.* p. 151 (1858).

Maxillary teeth 16 to 20, increasing in size posteriorly, the two last very large and separated from the others by a wide interspace; anterior mandibular teeth longest. Head elongate, distinct from neck; eye moderate, with round pupil. Body slender, very elongate; scales narrow, lanceolate, smooth, with apical pits, in 17 or 19 rows; ventrals without or with a very obtuse lateral keel. Tail very long; subcaudals in two rows.

Santo Domingo, West Indies.

Synopsis of the Species.

- | | |
|--|-------------------------------------|
| Snout twice as long as the eye, truncate at the end; rostral twice as broad as deep; scales in 17 rows; ventrals 163-176 | 1. <i>catesbyi</i> , p. 115. |

Dendrophis catesbyi, *Schleg. Phys. Serp.* ii. p. 226 (1837).

Uromacer catesbyi, *Dum. & Bibr. vii.* p. 721, pl. lxxxiii. fig. 2

(1854); *Jan, Icon. Gén.* 33, pl. iii. fig. 2 (1869).

Ahætulla catesbyi, *Günth. Cat.* p. 154 (1858).

Leptophis catesbyi, *Cope, Proc. Am. Philos. Soc.* xviii. 1879, p. 273.

Snout about twice as long as the eye, much depressed and truncate at the end. Rostral twice as broad as deep, scarcely visible from above; internasals longer than broad, shorter than the præfrontals; frontal twice as long as broad, as long as its distance from the end of the snout, slightly shorter than the parietals; nasal long and narrow, divided or semidivided; præfrontal in contact with the second labial; a small loreal between the præocular and the præfrontal; one or two præ- and two or three postoculars; tem-

porals 1+2; eight upper labials, third, fourth, and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 17 rows. Ventrals 163-176; anal divided; subcaudals 162-206. Olive-green above, each scale black-edged; upper lip, two or three outer rows of scales, and lower parts greenish white; a more or less distinct white lateral streak; a blackish streak on each side of the head and neck, passing through the eye.

Total length 1310 millim.; tail 580.

6. *Dromicus leucomelas*.

Dromicus leucomelas, *Dum. & Bibr.* vii. p. 666 (1854); *Jan, Icon. Gén.* 25, pl. ii. fig. 1 (1867); *Günth. Ann. & Mag. N. H.* (6) ii. 1888, p. 366.

Alsophis leucomelas, *Cope, Proc. Ac. Philad.* 1862, p. 76.

— *sibonius*, *Cope, Proc. Am. Philos. Soc.* xviii. 1879, p. 275; *Garm. Proc. Am. Philos. Soc.* xxiv. 1887, p. 283.

Eye moderate; snout moderate, somewhat projecting. Rostral

twice as broad as deep, scarcely visible from above; internasals as long as broad or a little longer, as long as or shorter than the præfrontals; frontal once and a half to once and three fourths as long as broad, longer than its distance from the end of the snout, as long as or a little shorter than the parietals; loreal tetra- or pentagonal, longer than deep; one (rarely two) præ- and two postoculars; temporals 1+2 or 1+1+2; eight upper labials, third, fourth, and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 19 rows. Ventrals obtusely angulate laterally, 191-210; anal divided; subcaudals 103-144. Length of tail $2\frac{2}{3}$ to $3\frac{2}{3}$ times in the total length. Coloration very variable: some specimens pale brown with dark brown spots or with a dark zigzag vertebral band, others yellow with black spots or black with yellow spots; a dark band on each side of the head, passing through the eye, sometimes continued along the body; belly yellow, uniform or with small black spots; hinder half of belly, and tail, frequently uniform black.

Total length 1300 millim.; tail 370.

West Indies (Antigua, Montserrat, Guadeloupe, Marie-Galante, Dominica).

— *cinereus*, *Garm. l.c.*

Eye moderate; snout projecting. Rostral much broader than deep, not or but scarcely visible from above; internasals as long as broad or a little longer, as long as or shorter than the præfrontals; frontal about twice as long as broad; loreal longer than deep; one (sometimes two) præ- and two postoculars; temporals 1+2; eight upper labials, third, fourth, and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 21 or 23 rows. Ventrals obtusely angulate laterally, 200-220; anal divided; subcaudals 91-122. Length of tail $3\frac{1}{4}$ to $4\frac{1}{2}$ times in the total length. Yellowish brown above, with dark brown spots or interrupted longitudinal streaks;

the spots vary exceedingly, and may be very small or so large as to nearly cover the ground-colour; a dark band on each side of the head, passing through the eye, widening on the temple, and sometimes continued along the body; lower parts yellow, more or less dotted with brown; in some specimens the hinder part of the body and the tail blackish brown.

Total length 1230 millim.; tail 270.

Fig. 12.

Maxillary and mandible of *Liophis pæcilogyrus*.

Maxillary teeth 14 to 24, followed, after a considerable interspace,

by two strongly enlarged ones; mandibular teeth subequal. Head slightly distinct from neck; eye moderate or rather large, in one species rather small, with round pupil. Body cylindrical; scale smooth, with apical pits, in 17 or 19 rows; ventrals not or but obtusely angulate laterally. Tail moderate or long; subcaudals in two rows.

South and Central America, West Indies, South-eastern North America.

Synopsis of the Species.

I. Tail 4 to 7 times in the total length; eye moderate or rather small, its length not twice its distance from the oral border.

A. Scales in 17 rows (exceptionally 19 in *L. tæniurus*).

1. Seven upper labials, third and fourth entering the eye; ventrals 128, subcaudals 31 1. *pygmaeus*, p. 129.

2. Eight upper labials, fourth and fifth entering the eye.

a. Internasals as long as broad.

a. Eye rather small; ventrals 187-195.

2. *triscalis*, p. 129.

β. Eye moderate; ventrals 148-185.

Anterior chin-shields as long as the posterior; subcaudals 53-57 3. *tæniurus*, p. 130.

Anterior chin-shields shorter than the posterior; subcaudals 70 5. *fraseri*, p. 131.

b. Internasals broader than long.

Frontal once and a half as long as broad, shorter than the parietals 4. *albiventris*, p. 130.

Frontal once and two thirds to twice as long as broad, as long as or a little shorter than the parietals 8. *melanotus*, p. 134.

B. Scales in 19 rows.

1. Snout not pointed.

Subcaudals 40-63 6. *pæcilogyrus*, p. 131.

Subcaudals 75-80 7. *perfuscus*, p. 133.

2. Snout rather pointed; rostral largely exposed above; subcaudals 58-73.

Ventrals 149-168 9. *almadensis*, p. 134.

Ventrals 169-197; uniform green above. . . . 10. *viridis*, p. 135.

II. Tail $4\frac{1}{2}$ to 6 times in the total length; eye rather large.

Scales in 19 rows 11. *typhlus*, p. 136.

Scales in 17 rows 12. *epinephelus*, p. 137.

III. Tail not more than 4 times in the total length; eye large or rather large; eight or nine upper labials.

A. Fourth and fifth upper labials entering the eye.

Ventrals 136-150; subcaudals 58-81 13. *reginæ*, p. 137.

Ventrals 157-164; subcaudals 64-85 14. *julice*, p. 139.

Ventrals 185-200; subcaudals 82-105 .. 15. *cursor*, p. 139.

B. Third, fourth, and fifth (or fourth, fifth, and sixth) upper labials entering the eye.

1. Eye not twice as long as its distance from the mouth.

Ventrals 140-150; subcaudals 85-106 .. 16. *andree*, p. 140.

Ventrals 145-165; subcaudals 110-130 .. 17. *parvifrons*, p. 141.

2. Eye twice as long as its distance from the mouth. [p. 142.
18. *melanostigma*,

IV. Tail not 4 times in the total length; eye moderate; seven upper labials, third and fourth entering the eye.

Scales in 19 rows; ventrals 131-134 19. *callilemus*, p. 142.

Scales in 17 rows; ventrals 167 20. *temporalis*, p. 143.

Scales in 17 rows; ventrals 126 21. *flavilatus*, p. 143.

1. *Liophis pygmæus*.

Liophis pygmæus, Cope, *Proc. Ac. Philad.* 1868, p. 103.

Head slightly distinct from neck, ovate, narrowed in front; snout slightly prominent. Rostral much broader than deep, just visible from above; internasals broader than long; frontal large, elongate, longer than its distance from the tip of the snout; supraoculars rather narrow; loreal subquadrate; one præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; chin-shields equal. Scales in 17 rows. Ventrals 128; anal divided; subcaudals 31. Above deep olive; leaden on the sides and the ends of the ventral shields; a black line from the eye to the angle of the mouth; a black occipito-nuchal collar, directed backwards; a series of black spots on each side, confluent into a band from the middle of the body to the end of the tail; below uniform yellow.

Total length 185 millim.; tail 30.

Napo or Upper Marañon.

 — *meleagris doliatus*, Cope, *Proc. Am. Philos. Soc.* xxiv. 1887, p. 57.

Eye moderate. Rostral broader than deep, visible from above; internasals as long as broad or a little broader, shorter than the præfrontals; frontal once and a half to once and two thirds as long as broad, as long as or a little longer than its distance from the end of the snout, as long as or shorter than the parietals; loreal as long as deep or deeper than long; one præ- and two postoculars; temporals 1 + 2; eight upper labials, fourth and fifth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are as long as or longer than the posterior. Scales in 19 rows. Ventrals 143-179; anal divided; subcaudals 40-63. Length of tail 5 to 6 times in the total length. Pale brownish, olive, greenish, or red above, spotted and reticulated with black, or with more or less distinct dark cross bands, or with alternating red and pale olive transverse bands; some specimens blackish, with small pale olive spots. Young with well-marked black spots arranged symmetrically, or with broad black cross bands, continuous across the back or interrupted and alternate, and separated by narrow pale interspaces; a broad black occipito-nuchal collar. Lower parts yellowish or red, usually spotted with black.

Total length 660 millim.; tail 120.

Brazil, Uruguay, Paraguay, Argentine Republic.

Liophis ornatus, Cope, Proc. U.S. Nat. Mus. xii. 1889, p. 141.

— *fugitivus*, Bouleng. Proc. Zool. Soc. 1891, p. 353.

Eye rather large; snout moderate. Rostral broader than deep, just visible from above; internasals a little broader than long, shorter than the præfrontals; frontal twice as long as broad, as long as or longer than its distance from the end of the snout, a little shorter than the parietals; loreal deeper than long; one præ- and two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are as long as the posterior. Scales in 17 rows. Ventrals obtusely angulate laterally, 185-200; anal divided; subcaudals 80-105. Length of tail $3\frac{2}{3}$ to 4 times in the total length. Black and olive or black and yellow above, usually with a light streak along each side of the hinder part of the body, sometimes extending to the nape; upper lip and lower parts yellow; usually a black spot or border at the outer end of each ventral.

Total length 830 millim.; tail 220.

20. *Liophis temporalis*.

Dromicus temporalis, Cope, *Proc. Ac. Philad.* 1860, p. 370; *Garm. Proc. Am. Philos. Soc.* xxiv. 1887, p. 281.

Mouth very inferior; rostral plate prominent, but barely visible from above; nasals distinct; internasals small; frontal broad; loreal confluent with præocular; one or two postoculars; seven upper labials, third and fourth entering the eye; chin-shields equal. Scales in 17 rows. Ventrals 167; anal divided; (tail mutilated). Chocolate-brown above, with a yellow lateral streak, edged with blackish above, running along the sutures of the two outer rows of scales; a blackish plumbeous band along the outer row of scales and the outer ends of the ventrals; indications of a yellow collar; belly yellow.

Length of head and body 430 millim.

Cuba.

21. *Liophis flavilatus*.

Dromicus flavilatus, Cope, *Proc. Ac. Philad.* 1871, p. 222, and *Proc. Am. Philos. Soc.* xiv. 1877, p. 65; *Garm. N. Am. Rept.* p. 58 (1883).

Closely allied to *L. callilemus*, but scales in 17 rows. Ventrals 126; subcaudals 77. Colour above a rich golden brown, the scales of the two lower rows on each side broadly gold-edged; head dark brown, darkest behind, with numerous but obscure paler vermiculations; sides of head paler, with a reddish-brown band from the rostral plate through the eye to the middle of the last labial; labials whitish, with black dots on the posterior; below white, lower labials sparsely black-dotted; a pair of pale dots on the common occipital suture.

S.E. United States (N. Carolina to Florida).

 — *saurocephalus*, *Wied, Beitr. Nat. Bras.* i. p. 359 (1825).
Xenodon severus, *Schleg. Phys. Serp.* ii. p. 83, pl. iii. figs. 1–5 (1837);
Dun. & Bibr. vii. p. 756 (1854); *Günth. Cat.* p. 54 (1858).
 — *severus*, part., *Jan, Arch. Zool. Anat. Phys.* ii. 1863, p. 317, and
Icon. Gén. 19, pl. iii. fig. B (1866).

Maxillary teeth 10–12+2. Head short, much depressed; body more or less depressed. Rostral twice as broad as deep, the portion visible from above measuring one fourth to one third its distance from the frontal; internasals nearly as long as broad, as long as the præfrontals or a little longer; frontal as long as broad or slightly longer, as long as or a little shorter than its distance from the rostral, shorter than the parietals; loreal deeper than long; one præ- and two or three (rarely four) postoculars; temporals 1+2 or 1+3; eight upper labials, fourth and fifth entering the eye; five or six lower labials in contact with the anterior chin-shields, which are larger than the posterior. Scales in 21 rows. Ventrals not angulate laterally, 128–149; anal divided; subcaudals 33–42. Young with angular, brown, dark-edged bands separated by narrow pale brown interspaces; usually a round white spot on the nape, and light and dark curved bands on the head; belly brown or black, with large yellowish spots on the sides. These markings usually become indistinct or disappear in the adult, some of which are pale brownish or greyish above and yellowish inferiorly; others have broad black bands across the body, or black edges to some or all of the scales, or the upper parts may be entirely black with a few small yellowish spots.

Total length 1500 millim.; tail 190.

Tropical South America.

78. LYSTROPHIS.

Heterodon, part., *Dum. & Bibr. Erp. Gén.* vii. p. 764 (1854); *Günth. Cat. Col. Sn.* p. 82 (1858); *Jan, Arch. Zool. Anat. Phys.* ii. 1864, p. 218.

Lystrophis, *Cope, Proc. Am. Philos. Soc.* xxii. 1885, p. 193.

Maxillary very short, shorter than ectopterygoid, with 4 or 5 small teeth, followed, after an interspace, by a pair of strongly enlarged fangs; mandibular teeth subequal. Head scarcely distinct from neck; snout very short, projecting, cuneiform; rostral very large, trihedral, with sharp A-shaped edge, produced posteriorly in a narrow branch separating the internasals; eye moderate, with round pupil. Body subcylindrical; scales slightly oblique, smooth, with apical pits, in 19 or 21 rows; ventrals obtusely angulate laterally. Tail short; subcaudals in two rows.

Southern parts of South America, east of the Andes.

Synopsis of the Species.

- Eye usually separated from the labials
by a series of suboculars; scales in
21 rows; ventrals 131-147; tail
pointed 1. *dorbignyi*, p. 151.
Eye in contact with two labials; scales
in 19 rows; ventrals 133-144; tail
pointed 2. *histricus*, p. 152.
Eye in contact with two labials; scales
in 21 rows; ventrals 153-173; tail
rounded off at the end 3. *semicinctus*, p. 153.

1. *Lystrophis dorbignyi*.

Heterodon dorbignyi, *Dum. & Bibr. Erp. Gén.* vii. p. 772 (1854); *Günth. Cat.* p. 83 (1858); *Jan, Arch. Zool. Anat. Phys.* ii. 1863, p. 221; *Hensel, Arch. f. Nat.* 1868, p. 329; *Jan, Icon. Gén.* 48, pl. iii. figs. 3 & 4 (1876); *Boettg. Zeitschr. f. ges. Naturw.* lviii. 1885, p. 233.

Lystrophis dorbignyi, *Cope, Proc. Am. Philos. Soc.* xxii. 1885, p. 193.

Frontal once and one third to once and a half as long as broad, nearly as long as or shorter than its distance from the end of the snout, as long as or longer than the parietals; an azygous shield separates the præfrontals; eye usually encircled by three to five shields, in addition to the supraocular; temporals 1+2; seven upper labials, third or fourth rarely entering the eye; four or five lower labials in contact with the anterior chin-shields; posterior chin-shields small. Scales in 21 rows. Ventrals 131-147; anal divided; subcaudals 29-44. Yellowish or pale brown above, with three series of large black or brown black-edged spots; three black **Λ**-shaped bands on the head and a larger one on the nape; lower parts black and yellow (red?), the two colours in nearly equal proportion.

Total length 560 millim.; tail 80.

Southern Brazil, Paraguay, Uruguay, Argentina, Southern Chili.

Heterodon simus kennealyi, *Coues & Yarrow, l. c.* p. 271.

Maxillary teeth 6 to 8+2. Rostral as broad as the distance between the eyes; several small shields separating the internasals and the præfrontals; frontal as broad as long or broader, shorter than its distance from the end of the snout, as long as or longer than the parietals; eye surrounded by 10 or 11 shields in addition to the supraocular; eight upper labials; one pair of chin-shields, in contact with three or four lower labials. Scales all, except the outer row, strongly keeled, in 23 rows. Ventrals 126-150; anal divided; subcaudals 32-45. Pale brown or yellowish above, with three alternating series of brown spots, the median largest and usually broadest; a dark cross band between the eye, a broad oblique band from the eye to the mouth, and three elongate blotches behind the head; belly yellowish white, with deep black blotches, or entirely black in the middle.

Total length 600 millim.; tail 70.

United States, west of the Mississippi, North Mexico.

1. *Rhadinæa leucogaster*.

Liophis leucogaster, Jan, *Arch. Zool. Anat. Phys.* ii. 1863, p. 289, and *Icon. Gén.* 13, pl. vi. fig. 1 (1865).

Eye rather small; rostral broader than deep, just visible from above; internasals broader than long; suture between the internasals a little shorter than that between the præfrontals; frontal about once and a half as long as broad, longer than its distance from the end of the snout, as long as the parietals; latter as long as their distance from the internasals; loreal square; one præ- and one postocular; temporals 1+2; six upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are as long as the posterior. Scales in 17 rows. Ventrals 140; anal divided; subcaudals 30. Brown above, with black cross bands, some of the scales on the middle line between the bands edged with white; a black lateral stripe on the hinder part of the body, extending to the ends of the ventrals; lower surface white.

Total length 180 millim.; tail 28.

Habitat unknown.

2. *Rhadinæa breviceps*.

Liophis breviceps, Cope, *Proc. Ac. Philad.* 1860, p. 252.

Ophiomorphus breviceps, Cope, *Proc. Ac. Philad.* 1862, p. 75.

Eye rather small; rostral broader than deep, just visible from above; internasals broader than long, a little shorter than the præ-frontals; frontal not quite once and a half as long as broad, longer than its distance from the end of the snout, slightly shorter than the parietals; latter as long as their distance from the rostral; loreal deeper than long; one præ- and two postoculars; temporals 1+2; six or seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are as long as or a little longer than the posterior. Scales in 17 rows. Ventrals 154; anal divided; subcaudals 48-54. Length of tail $5\frac{1}{2}$ to $5\frac{3}{4}$ times in the total length. Brown above, the scales edged with black, with more or less regular narrow black cross bands; below with black and white (red?) cross bands of subequal width.

Total length 450 millim.; tail 80.

Ecuador; Surinam.

a. ♂ (V. 154; C. 48).

W. Ecuador.

Mr. Fraser [C.].

b. ♀ (V. 154; C. 48).

Paltanga, Ecuador.

Mr. Buckley [C.].

3. *Rhadinæa calligaster*.

Contia calligaster, Cope, *Journ. Ac. Philad.* viii. 1876, p. 146, pl. xxviii. fig. 12.

Snout narrowed; one nasal shield; loreal subquadrate; one præ- and two postoculars; temporals 1+1 or 1+2; seven upper labials, third and fourth entering the eye; anterior and posterior chin-shields equal. Scales in 17 rows. Ventrals 152; anal divided; subcaudals 46. Dark brown above, with a narrow black vertebral stripe; two lateral paler stripes; a black stripe along the ends of the ventrals; labials broadly black bordered; belly yellow, with a series of black crescents on the median front of each suture; middle line of tail below black.

Pico Blanco, Costa Rica.

4. *Rhadinæa mimus*.

Opheomorphus mimus, Cope, *Proc. Ac. Philad.* 1868, p. 307.

Snout short; internasals broader than long; frontal shorter than parietals; loreal very small or absent; one præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye. Scales in 15 rows. Crimson, each scale with a brown spot near its tip; ten black rings on the body, complete across the belly; head above and spot below eye black.

Total length 340 millim.; tail 60.

Andes of Ecuador or Colombia.

5. *Rhadinæa anomala*.

Coronella anomala, Günth. Cat. p. 37 (1858), and Zool. Rec. 1866, p. 126; Bouleng. Ann. & Mag. N. H. (5) xviii. 1886, p. 431.

Lygophis rutilus, Cope, Proc. Ac. Philad. 1862, p. 80, and 1863, p. 101.

Coronella pulchella, Jan, Arch. Zool. Anat. Phys. ii. 1863, p. 251, and Icon. Gén. 17, pl. iii. fig. 4 (1866).

Aporophis anomalus, Cope, Proc. Am. Philos. Soc. xvii. 1877, p. 93.

Eye moderate. Rostral broader than deep, just visible from above; internasals as long as broad, as long as or a little shorter than the præfrontals*; frontal narrow, twice as long as broad, as long as or a little longer than its distance from the end of the snout, as long as the parietals; loreal as long as deep or a little longer†; one præ- and two postoculars; temporals 1+2; eight (exceptionally seven) upper labials, fourth and fifth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are as long as or a little longer than the posterior. Scales in 19 rows. Ventrals indistinctly angulate laterally, 147-159; anal divided; subcaudals 50-73. Length of tail $4\frac{1}{3}$ to $5\frac{1}{2}$ times in the total length. Brown or olive above, with large black spots dotted with yellow, and two yellow longitudinal lines or series of spots; the black spots forming symmetrical vertical bars on the sides; belly yellow.

Total length 570 millim.; tail 105.

Eye rather small. Rostral broader than deep, visible from above; internasals as long as broad or a little broader, as long as or a little shorter than the præfrontals; frontal once and a half to once and three fourths as long as broad, as long as or slightly longer than its distance from the end of the snout, a little shorter than the parietals; loreal as long as deep or deeper than long; one præ- and two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are as long as or a little longer than the posterior. Scales in 17 rows. Ventrals 143-163; anal divided; subcaudals 45-57. Length of tail $4\frac{2}{3}$ to 6 times in the total length. Brown or blackish above, with whitish lines or cross bands; belly yellowish (coral-red in life) with transverse black spots or cross bands, always more or less marked in the young, which have a blackish nuchal collar edged behind with whitish, and a

pair of whitish dots close together on the parietal shields; upper labials yellowish.

Total length 730 millim.; tail 125.

Guianas, Brazil.

A. Brown above, with darker spots and white edges to some of the scales, the assemblage of short white lines sometimes forming irregular cross bands. (*C. cobella*.)

Coronella tæniolata, *Boettg. Ber. Senck. Ges.* 1888, p. 195.

Snout very short; rostral broader than deep, scarcely visible from above; internasals as long as broad, or a little broader, shorter than the præfrontals; frontal once and a half to once and two thirds as long as broad, longer than its distance from the end of the snout, shorter than the parietals; loreal as long as deep or deeper than long; one præ- and two postoculars; temporals 1+2 (rarely 2+2); eight upper labials, third, fourth, and fifth entering the eye; four lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 17 rows. Ventrals 149-167;

anal divided; subcaudals 52–85. Length of tail 3 to 4½ times in the total length. Brown above, with a blackish vertebral streak or zigzag band, becoming indistinct on the anterior part of the body in the adult; a black streak from the eye to the side of the neck, and another along each side of the tail; upper labials yellowish, uniform or spotted with black, or blackish spotted with yellow; a light, black-edged spot on each side of the nape, and usually a pair of light dots close together on the parietals; yellowish inferiorly, uniform or the edges of the ventrals blackish; a black spot at the outer end of each ventral; chin and throat usually dotted or spotted with black.

Total length 410 millim.; tail 135.

Rhadinæa occipitalis, *Bouleng. Ann. & Mag. N. H.* (6) xiii. 1894, p. 347.

* I have examined a specimen from Cayenne, preserved in the Basle Museum.

Rostral broader than deep, scarcely visible from above; internasals broader than long, shorter than the præfrontals; frontal nearly twice as long as broad, much longer than its distance from the end of the snout, and slightly shorter than the parietals; loreal as long as deep, or a little deeper than long; one præ- and two postoculars; temporals 1+2 or 2+2; eight upper labials, third, fourth, and fifth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are shorter than the posterior. Scales in 15 rows. Ventrals 152-183; anal divided; subcaudals 64-86. Tail $3\frac{2}{3}$ to $4\frac{1}{2}$ times in the total length. Back olive-brown, with two alternating series of blackish, light-edged spots, which are largest and sometimes confluent into cross bands on the anterior part of the body, and may be lost altogether posteriorly; sides usually darker, sometimes blackish grey; head brown above, with a blackish lateral streak, passing through the eyes, and a white line round the snout, along the canthus rostralis and supraciliary edge; usually a pair of white dots close together on the parietals; sometimes a pair of larger light spots on the occiput; upper lip white; belly white, with a lateral series of black dots, which may be confluent into a longitudinal line.

Total length 475 millim.; tail 105.

Coronella vermiculaticeps, Günth. *Biol. C.-Am., Rept.* p. 111 (1893).

Snout short, eye large; frontal elongate; loreal as deep as long; one præ- and two postoculars; eight upper labials, fourth and fifth entering the eye; posterior chin-shields longer than the anterior. Scales in 17 rows. Ventrals 117; anal divided; subcaudals 79. Yellowish brown above, with two deep brown dorsal streaks, separated by the width of one scale, diverging on the neck and extending to the outer posterior angle of the supraocular shield; another dark streak on each side of head and body, passing through the eye; head brown above, vermiculated with yellowish; labials whitish, narrowly edged with brown; chin and belly yellowish white, each ventral with a deep brown dot at each end near the posterior border.

Total length 330 millim.; tail 115.

Veragua, Costa Rica.

23. *Rhadinæa clavata*.

Dromicus clavatus, Peters, *Mon. Berl. Ac.* 1864, p. 388; Bocourt, *Miss. Sc. Mex., Rept.* p. 711, pl. xlv. fig. 2 (1890).

Rostral visible from above; frontal once and a half as long as broad, a little shorter than the parietals; loreal a little longer than deep; one præ- and two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; four lower labials in contact with the anterior chin-shields. Scales in 19 rows. Ventrals 127; anal divided; subcaudals 89. Pale brown above, with three dark longitudinal lines; head brown above, with a dark longitudinal streak on the frontal, and a yellow line on each side beginning above the nostril and terminating club-shaped behind the eye; a short yellowish-brown longitudinal band on each side of the nape; labials yellowish white, edged above by a black line; beneath yellow.

Total length 240 millim.; tail 87.

Mexico.

Leiosophis, part., *Jan, l. c.* p. 320.

Cyclagras, part., *Cope, Proc. Am. Philos. Soc.* xxiii. 1886, p. 488.

Maxillary teeth 11 to 14, increasing in size posteriorly, followed after a short interspace by two enlarged ones; mandibular teeth subequal. Head scarcely distinct from neck; eye moderate or rather small, with round pupil; usually one or more subocular shields. Body cylindrical; scales smooth, without apical pits, in 17 to 21 rows; ventrals rounded. Tail long, thick throughout, ending obtusely; subcaudals in two rows.

Cuba, Central and South America.

Synopsis of the Species.

I. Eye in contact with two labials; scales in 17 rows.

A. Four lower labials in contact with the anterior chin-shields.

Anterior chin-shields much shorter than the posterior; temporals 1+2 1. *dumerilii*, p. 181.

Anterior chin-shields as long as the posterior; temporals 1+1 2. *lateristriga*, p. 181.

B. Five or six lower labials in contact with the anterior chin-shields.

Temporals 1 + 2; black above, with narrow bright transverse lines 3. *curyzona*, p. 182.

Temporals usually 1 + 1; red with black or black and yellow rings 4. *elapoides*, p. 182.

II. Eye separated from the labials by a series of suboculars; scales in 19 or 21 rows 5. *bicincta*, p. 184.

1. *Urotheca dumerilii*.

Urotheca dumerilii, *Bibr. in R. de la Sagra, Hist. Cuba, Rept.* p. 218, pl. xxvi. (1843).

Dromicus dumerilii, *Garm. Proc. Am. Philos. Soc.* xxiv. 1887, p. 280.

Eye moderate; snout short, truncate. Rostral just visible from above; internasals half as long as præfrontals; frontal once and two thirds as long as broad, longer than its distance from the end of the snout, shorter than the parietals; loreal as long as deep; two præoculars, with a small subocular below them; two postoculars; temporals 1 + 2; eight upper labials, fourth and fifth entering the eye; four lower labials in contact with the anterior chin-shields, which are much shorter than the posterior. Scales in 17 rows. Ventrals 128-153; anal divided. The tail of the type specimen is probably mutilated, hence the small number (42) of subcaudals. Brown above; a blackish lateral streak, running along the outer ends of the ventrals; lower parts orange.

Total length 344 millim.

Cuba.

2. *Urotheca lateristriga*.

Liophis lateristriga, *Berth. Götting. Anz.* iii. 1859, p. 180; *Jan, Arch. Zool. Anat. Phys.* ii. 1863, p. 303, and *Icon. Gén.* 18, pl. v. fig. 2 (1866).

Ablabes decipiens, *Günth. Biol. C.-Am., Rept.* p. 105, pl. xxxvii. fig. A (1893).

Eye rather small; snout very short, rounded. Rostral much broader than deep, just visible from above; internasals much shorter than the præfrontals; frontal about once and a half as long as broad, longer than its distance from the end of the snout, shorter than the parietals; loreal nearly as long as deep (fused with the lower præocular in one of the specimens in the collection); one or two præoculars, usually with a small subocular below; two postoculars; temporals 1 + 1; eight upper labials, fourth and fifth entering the eye; four lower labials in contact with the anterior chin-shields, which are nearly as long as the posterior. Scales in 17 rows.

Ventrals 133-163; anal divided; subcaudals 83-110. Brown above, with one or two yellowish streaks along each side, the lowermost bordered inferiorly by a dark purplish-brown streak running along the ends of the ventrals and the lower half of the outer row of scales; this dark streak may be replaced by a series of black spots along the outer ends of the ventrals; a dark brown streak on each side of the head, passing through the eye; upper labials yellowish above, brown inferiorly; lower parts uniform yellowish.

Total length 580 millim.; tail 200.

Costa Rica, Colombia, Ecuador, Venezuela.

Elapochrus euryzona, Günth. *Biol. C-Am., Rept.* p. 197 (1893).

Eye moderate; snout short and broad. Rostral twice as broad as deep, just visible from above; internasals half as long as the præfrontals; frontal about once and a half as long as broad, slightly longer than its distance from the end of the snout, shorter than the parietals; loreal as long as deep; one præocular, with a small subocular below it; two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are a little shorter than the posterior. Scales in 17 rows. Ventrals 120-138; anal divided; subcaudals 116. Black above, with narrow pale (red?) transverse lines, about half the length of a scale, and equidistant; these lines widen into irregular broad cross bars on the abdomen, where the red and black are in nearly equal proportions; a few small pale spots on the head.

Total length 560 millim.; tail 260.

Liophis elapoides, Garm. *N. Am. Rept.* p. 69 (1883); Bocourt, *Miss. Sc. Mex., Rept.* p. 635, pl. xli. fig. 6 (1886).
 — *elapoides*, vars. *diastema et æqualis*, Bocourt, *l. c.* figs. 7 & 8.
Elapochrus æqualis, Günth. *Biol. C.-Am., Rept.* p. 106, pl. xxxvi. fig. A (1893).
 — *dimidiatus*, Günth. *l. c.* p. 107.

Eye rather small; snout short, rounded. Rostral nearly twice as broad as deep, just visible from above; internasals shorter than the præfrontals; frontal as long as or a little longer than its distance from the end of the snout, shorter than the parietals; loreal as long as deep; one or two præoculars and a small subocular; two postoculars; temporals 1+1 (rarely 1+2); eight (rarely nine) upper labials, fourth and fifth (or fifth and sixth) entering the eye; five lower labials in contact with the anterior chin-shields, which are a little longer than the posterior. Scales in 17 rows. Ventrals 124-143; anal divided; subcaudals 85-127. Red above, the scales usually tipped with black, with single or triple black annuli, the annuli when triad separated by yellow interspaces; some large black spots may be present on the red areas; head black in front and behind, with a yellow band across the parietal shields and the temples; belly yellowish between the rings.

Total length 550 millim.; tail 240.

Mexico, Guatemala, Costa Rica.

The individuals of this species vary immensely in the number and arrangement of the annuli, as may be seen by referring to the descriptions and figures quoted in the synonymy. I am therefore disposed to regard the forms *diastema* (5 triad annuli on the body) and *æqualis* as extreme colour-varieties of one species. I have dealt in the same manner with *Atractus elaps* and *A. latifrons*, which present analogous variations.

A. Black annuli triad, with yellow interspaces.

a. 7 to 10 annuli on the body; irregular black blotches on the red areas.

Leiophis bicinctus, Jan, *Arch. Zool. Anat. Phys.* ii. 1863, p. 321.

Eye rather small; snout short, rounded. Rostral much broader than deep, just visible from above; internasals as long as or shorter than the præfrontals; frontal as long as broad or a little longer, as long as or shorter than its distance from the end of the snout, shorter than the parietals; loreal nearly as long as deep or longer than deep; six scales surround the eye in addition to the supraocular, the labials being excluded from the eye; temporals 2+2 or 3+3; eight or nine upper labials; chin-shields short. Scales in 19 or 21 rows. Ventrals 168-192; anal entire; subcaudals 69-94. Reddish brown above, with black annuli arranged in pairs, each pair bordered with yellow in front and behind; a black band behind the eye, confluent with another across the occiput and descending to the gular region; belly yellow, spotted with black; tail with complete annuli.

Total length 1950 millim.; tail 650.

83. *TRIMETOPON*.

Trimetopon, Cope, *Proc. Amer. Philos. Soc.* xxii. 1885, p. 177.

Maxillary short, with 12 teeth, which gradually increase in length to the last; mandibular teeth subequal. Head scarcely distinct from neck; eye small, with round pupil; a single præfrontal. Body elongate, cylindrical; scales smooth, with very indistinct apical pits, in 15 rows; ventrals rounded. Tail moderate; subcaudals in two rows. Central America.

1. *Trimetopon gracile*.

Ablabes gracilis, Günth. *Ann. & Mag. N. H.* (4) ix. 1872, p. 18, pl. iii. fig. D.

Trimetopon gracile, Cope, *Proc. Amer. Philos. Soc.* xxii. 1885, p. 177.

Snout short, rounded. Rostral more than twice as broad as deep, scarcely visible from above; internasals small, much broader than deep; præfrontal nearly twice as broad as deep; frontal once and one third to once and a half as long as deep, a little longer than its distance from the end of the snout, much shorter than the parietals; loreal small, longer than deep; one præ- and one postocular; temporals 1+1; seven or eight upper labials, third and fourth or fourth and fifth entering the eye; four or five lower labials in

contact with the anterior chin-shields, which are longer than the posterior. Scales in 15 rows. Ventrals 141–149; anal divided; subcaudals 60–65. Dark brown above, with five blackish longitudinal lines; a more or less distinct yellowish collar; lateral scales lighter in the centre; labials yellowish, spotted with black; lower parts uniform whitish.

Total length 290 millim.; tail 77.

Costa Rica.

a-b. ♂ (V. 149, 141; C. 65, 60). Cartago, Costa Rica. (Types.)

84. HYDROMORPHUS.

Hydromorphus, *Peters, Mon. Berl. Ac.* 1859, p. 276.

Maxillary short, with 14 teeth, which gradually increase in length to the last; mandibular teeth subequal. Head scarcely distinct from neck; eye very small, with round pupil; a single præfrontal; nostril directed upwards, in a single shield; loreal entering the eye. Body rather elongate, cylindrical; scales smooth, in 17 rows; ventrals rounded. Tail short; subcaudals in two rows.

Central America.

1. *Hydromorphus concolor*.

Hydromorphus concolor, *Peters, l. c.* p. 277, pl. —. fig. 3.

Head much depressed, with broadly rounded snout. Nostrils directed upwards, the nasals separated by a pair of very small internasals; præfrontal twice as broad as long; frontal slightly longer than broad, as long as its distance from the rostral, much shorter than the parietals; loreal twice as long as deep; a small præocular between the supraocular and the loreal; two postoculars; temporals 1+2; six upper labials, third bordering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields small. Scales in 17 rows. Ventrals 175; anal divided; subcaudals 31. Dark greyish brown above; sides and lower parts paler, the scales and shields being partly yellowish.

Total length 850 millim.; tail 86.

Costa Rica.

Snout very short, rounded; rostral broader than deep, just visible from above, in contact with the nasal fissure; nasals in contact behind the rostral; internasals small, rhomboidal, at least twice as broad as long; frontal twice to twice and a half as long as broad, longer than its distance from the end of the snout, shorter than the parietals; one præ- and two postoculars; temporals 1+2; eight upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are as long as or a little longer than the posterior. Scales in 15 rows. Ventrals 129–140; anal divided; subcaudals 32–51. Brown above, uniform or with two rows of small black spots; a black lateral band, with a series of small whitish spots; a black streak on each side of the head, passing through the eye; lips yellowish, spotted or vermiculated with brown; belly yellowish with black dots, which may form regular longitudinal series; a series of large black dots runs along each side of the belly, on the first row of scales, and is continued on the subcaudals.

Total length 920 millim.; tail 120.

Maxillary teeth 12 to 20, increasing in size posteriorly, some-

times very slightly; mandibular teeth subequal. Head not or but slightly distinct from neck; eye moderate or rather small, with round pupil. Body cylindrical or slightly compressed; scales smooth, with apical pits, in 15 to 25 rows; ventrals not or but obtusely angulate laterally. Tail moderate; subcaudals in two rows.

Europe, South-western Asia, India, Africa, America north of the Equator.

Fig. 16.

Skull of *Coronella austriaca*.

Synopsis of the Species.

I. One præocular; scales in 17 rows or more.

A. Anal divided; scales in 19-21 rows.

1. Rostral as deep as broad; usually two superposed anterior temporals.

Third and fourth (rarely fourth and fifth)
labials entering the eye; scales in 19
rows

1. *austriaca*, p. 191.

Fourth and fifth labials entering the eye;
scales in 21 rows

2. *amalia*, p. 193.

2. Rostral much broader than deep; usually two or three
superposed anterior temporals; scales usually in 21 rows.

Supraocular extensively in contact with
the præfrontal

3. *girondica*, p. 194.

Præocular reaching or nearly reaching the
frontal

4. *semiornata*, p. 195.

3. Rostral a little broader than deep; a single anterior temporal; scales in 19 rows.

Four lower labials in contact with the anterior chin-shields; belly yellow 5. *coronata*, p. 196.

Five lower labials in contact with the anterior chin-shields; belly blackish 6. *regularis*, p. 196.

B. Anal undivided.

1. Upper portion of rostral broad; normally seven upper labials.

a. Scales in 19-25 rows; ventrals 198-240, not angulate laterally; rostral once and a half as broad as deep.

Eye moderate; scales in 19-23 rows; dark brown or black above, with yellow or white markings 7. *getula*, p. 197.

Eye small; scales in 21-25 rows 8. *calligaster*, p. 198.

b. Scales in 21-23 rows; ventrals 188-214; rostral twice as broad as deep.

Portion of rostral visible from above measuring less than one fourth its distance from the frontal 9. *leonis*, p. 199.

Portion of rostral visible from above measuring one third to one half its distance from the frontal 10. *triangulum*, p. 200.

c. Scales in 19-25 rows, usually 21 or 23; ventrals angulate laterally; rostral once and a half as broad as deep.

Ventrals 179-210; first black band on nape only 11. *gentilis*, p. 201.

Ventrals 198-224; body compressed; first black band on nape only 12. *zonata*, p. 202.

Ventrals 204-240; first black band forming a complete ring, extending across the throat 13. *micropholis*, p. 203.

d. Scales in 17-19 rows; ventrals 161-180.

14. *doliata*, p. 205.

2. Upper portion of rostral not broader than the anterior nasal; eight upper labials 15. *brachyura*, p. 206.

II. Usually two præoculars; anal divided; scales in 15-17 rows.

Scales in 15 rows; ventrals 136-160 16. *punctata*, p. 206.

Scales in 15 rows; ventrals 182-222 17. *amabilis*, p. 207.

Scales in 17 rows; ventrals 183-237 18. *regalis*, p. 208.

Snout obtuse or more or less prominent; rostral at least as deep as broad, more or less produced posteriorly between the internasals, the portion visible from above at least half as long (in some specimens quite as long) as its distance from the frontal, rarely separating the internasals, which are shorter than the prefrontals; frontal as long as or longer than its distance from the end of the snout, shorter than the parietals; loreal longer than deep; one (rarely two) pre- and two postoculars; temporals 2+2 or 2+3 (rarely 1+2); seven (rarely eight) upper labials, third and fourth (or fourth and fifth) entering the eye; four (rarely three) lower labials in contact with the anterior chin-shields, which are as long as or longer than the posterior. Scales in 19 rows. Ventrals 153–199; anal divided (rarely entire); subcaudals 42–70. Brown or reddish above, often with one or three lighter stripes, with small dark brown or brick-red spots usually disposed in pairs; frequently two dark brown or brick-red stripes on the nape, usually confluent with a large dark blotch on the occiput; a dark streak on each side of the head, from the nostril to the angle of the mouth, passing through the eye, sometimes extending along each side of the neck; lower parts red, orange, brown, grey, or blackish, uniform or speckled with black and white. Spec. *u* is pale brown above, with four black lines along the anterior part of the body, and two small, yellowish, dark-edged spots close together on the back of the head, separated by the parietal suture.

Total length 720 millim.; tail 140.

Europe, as far north as 62½° (in Great Britain only in Hampshire and Dorsetshire, perhaps also in Surrey), Transcaucasia, Talysh Syria.

Am. Rept. pp. 66 & 156 (1883).

Eye small. Snout scarcely prominent. Rostral about once and a half as broad as deep, the portion visible from above measuring about one third its distance from the frontal; suture between the internasals shorter than that between the præfrontals; frontal considerably longer than broad, as long as or longer than its distance from the end of the snout, shorter than the parietals; loreal longer than deep; one præ- and two postoculars; temporals 1+2 or 2+3; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are longer than the posterior. Scales in 21 to 25 rows. Ventrals 192-213; anal entire; subcaudals 40-52. Pale brown above, with large, transversely elliptic, dark, black-edged spots on the back and an alternating series of smaller ones along the side; a pair of elongate dark spots or bands on the nape, and a dark oblique streak behind the eye; red inferiorly, with brown spots.

Total length 790 millim.; tail 110.

North America east of the Rocky Mountains, as far north as Virginia.

9. *Coronella leonis*.

Coronella leonis, Günth. *Biol. C.-Am., Rept.* p. 110, pl. xxxix. fig. A (1893).

Snout longer and eye larger than in *C. triangulum*. Rostra twice as broad as deep, just visible from above; suture between the internasals about two thirds the length of that between the præfrontals; frontal a little longer than broad, as long as its distance from the rostral, shorter than the parietals; loreal twice as long as deep; one præ- and two postoculars; temporals 2+3; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are longer than the posterior. Scales in 23 rows. Ventrals 200; anal entire; subcaudals 51. Grey above, with a dorsal series of ∞-shaped red, black-edged spots; a -shaped marking on the nape; a black blotch with red centre on the frontal and another on each parietal

and a small oblique black spot on the temple; belly yellowish, with a few black blotches; an interrupted black stripe along the lower surface of the tail.

Total length 610 millim.; tail 95.

Nuevo Leon, North Mexico.

Zamenis brachyurus, *Günth. Ann. & Mag. N. H.* (3) xviii. 1806, p. 27, pl. vi. fig. A.; *Blanf. Journ. As. Soc. Beng.* xxxix. 1870, p. 372; *Anders. Proc. Zool. Soc.* 1871, p. 176; *Theob. Cat. Rept. Brit. Ind.* p. 171 (1876).

Coronella brachyura, *Bouleng. Faun. Ind., Rept.* p. 309 (1890).

Rostral broader than deep, visible from above; suture between the internasals shorter than that between the præfrontals; frontal once and a half as long as broad, as long as its distance from the end of the snout, a little shorter than the parietals; loreal as long as deep; one præocular; two postoculars; temporals 2+2; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are slightly longer than the posterior; the latter widely separated from each other by three series of scales. Scales in 23 rows. Ventrals 213-223; anal entire; subcandals 46-53. Olive-brown above, with rather indistinct light variegations on the anterior half of the body; lower surface whitish.

Total length 445 millim.; tail 55.

Deccan.

a. ♀ (V. 223; C. 46).

Poonah.

Dr. Leith [P.]. (Type.)

Snout not prominent; rostral nearly twice as broad as deep, just visible from above; suture between the internasals shorter than that between the præfrontals; frontal a little longer than its distance from the end of the snout, about two thirds the length of the parietals; loreal as long as deep or a little deeper than long; two (rarely one) præ- and two postoculars; temporals 1+1; seven upper labials, third and fourth entering the eye, or eight, fourth

and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are longer than the posterior. Scales in 15 rows. Ventrals 136-160; anal divided; subcaudals 36-62. Dark grey above, with the upper lip and a nuchal collar yellow and black-edged; yellow or orange inferiorly, each ventral with a small black spot at its outer extremity.

Total length 360 millim.; tail 65.

North America, east of the Rocky Mountains; Mexico.

A. A median row of black spots along the belly.

89. *HYP SIGLENA*.

Hypsigena, Cope, *Proc. Ac. Philad.* 1860, p. 246, and *Proc. U.S. Nat. Mus.* xiv. 1892, p. 617.

Pseudodipsas, Peters, *Mon. Berl. Ac.* 1860, p. 521.

Comastes, Jan, *Elenco sist. Ofid.* p. 102 (1863).

Maxillary teeth 12 to 16, the two posterior strongly enlarged and separated from the rest by an interspace; mandibular, teeth

subequal. Head distinct from neck; eye rather small, with vertically elliptic pupil. Body cylindrical; scales smooth, with apical pits, in 19 or 21 rows; ventrals rounded. Tail moderate; subcaudals in two rows.

Southern parts of North America, Central America, Venezuela.

Synopsis of the Species.

I. Subcaudals 39-55.

A. Scales in 21 rows; usually a subocular below the præocular.

Rostral once and a half as broad as deep, the portion visible from above nearly half as long as its distance from the frontal

1. *ochrorhynchus*, p. 209.

Rostral nearly twice as broad as deep, the portion visible from above one fourth to one third its distance from the frontal

2. *torquata*, p. 210.

B. Scales in 19 rows; no subocular..

3. *affinis*, p. 210.

II. Subcaudals 80-93.

Scales in 19 rows

4. *discolor*, p. 211.

Scales in 21 rows; body cylindrical ..

5. *latifasciata*, p. 211.

Scales in 21 rows; body feebly compressed

6. *ornata*, p. 211.

1. *Hypsiglena ochrorhynchus*.

Hypsiglena ochrorhyncha, Cope, *Proc. Ac. Philad.* 1860, p. 246; *Germ. N. Am. Rept.* p. 80 (1883); Cope, *Proc. U.S. Nat. Mus.* xiv. 1892, p. 617; *Stejneger*, *N. Am. Faun.* no. 7, pt. ii. p. 204 (1893).

— *texana*, *Stejneger*, *l. c.* p. 205.

— *torquata*, var., *Günth. Biol. C.-Am., Rept.* p. 137 (1894).

Snout conical, prominent. Rostral once and a half as broad as deep, the portion visible from above nearly half as long as its distance from the frontal; internasals shorter than the præfrontals; frontal once and one third to once and a half as long as broad, as long as or a little longer than its distance from the end of the snout, much shorter than the parietals; loreal longer than deep; one præocular, usually with a subocular below it; two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye: four or five lower labials in contact with the anterior chinshields, which are as long as or a little shorter than the posterior. Scales in 21 rows. Ventrals 167-175; anal divided; subcaudals 41-55. Grey or pale buff above, with a dorsal series of large transverse dark brown or blackish spots and two alternating series of smaller spots on each side; three elongate dark blotches on the nape, the lateral ones produced forwards as a lateral streak, which passes through the eye and is white-edged beneath; upper surface

of head and lips finely dotted with dark brown; lower parts uniform white.

Total length 225 millim.; tail 57.

Lower California, California, Arizona, Texas, North Mexico.

a-b. ♀ (V. 172, 171; C. Duval Co., Texas. W. Taylor, Esq. [P.]. 41, 43).

c. ♂ (V. 168; C. 45). Nuevo Leon, Mexico. W. Taylor, Esq. [P.].

2. *Hypsiglena torquata*.

Leptodira torquata, *Günth. Ann. & Mag. N. H.* (3) v. 1860, p. 170, pl. x. fig. A; *Peters, Mon. Berl. Ac.* 1860, p. 521.

Comastes quincunciatus, *Jan, Elenco*, p. 102 (1863), and *Icon. Gén.* 38, pl. i. fig. 1 (1871).

Hypsiglena torquata, *Cope, Bull. U.S. Nat. Mus.* no. 32, 1887, p. 78. — *torquata*, part., *Günth. Biol. C.-Am., Rept.* p. 137 (1894).

Snout rounded, obtuse. Rostral nearly twice as broad as deep, the portion visible from above one fourth to one third as long as its distance from the frontal; internasals shorter than the præfrontals; frontal once and one third to once and a half as long as broad, as long as or a little longer than its distance from the end of the snout, much shorter than the parietals; loreal longer than deep; one præocular, with a subocular below it; two postoculars; temporals 1+2; eight (exceptionally seven) upper labials, fourth and fifth (or third and fourth) entering the eye; five lower labials in contact with the anterior chin-shields, which are a little shorter than the posterior. Scales in 21 rows. Ventrals 169-174; anal divided; subcaudals 41-55. Greyish or pale brown above, with a dorsal or two alternating dorsal series of large dark brown spots separated by yellowish interspaces; sides with two or three alternating series of small dark brown spots; a large dark brown blotch on the nape, preceded by a yellow collar; a dark brown streak on each side of the head, passing through the eye; head speckled with dark brown; lower parts white.

Total length 400 millim.; tail 60.

Mexico to Venezuela.

a. ♂ (V. 169; C. 53). Ventanas, Durango. Hr. A. Forrer [C.].

b-c. ♂ (V. 170, 171; C. 49, 50). Presidio, near Mazatlan. Hr. A. Forrer [C.].

d. ♀ (V. 174; C. 41). Nicaragua. Derby Museum. (One of the types.)

3. *Hypsiglena affinis*. (PLATE VIII. fig. 1.)

Hypsiglena torquata, var., *Günth. Biol. C.-Am., Rept.* p. 137 (1894).

Agrees in structure and coloration with *H. torquata*, except that the subocular is absent, the upper labials are seven in number, third and fourth entering the eye, and the scales form only 19 rows. Ventrals 162-168; subcaudals 39-51.

Total length 310 millim.; tail 52.

Mexico.

a. ♂ (V. 164; C. 43). Zacatecas. J. M. Cameron, Esq. [P.].

Zacatecas.
c. ♀ (V. 162; C. 51). Jalisco. F. D. Godman, Esq. [P.].

4. *Hypsiglena discolor*.

Leptodira discolor, Günth. *Proc. Zool. Soc.* 1860, p. 317.

Hypsiglena discolor, Cope, *Bull. U.S. Nat. Mus.* no. 32, 1887, p. 78;
Günth. *Biol. C.-Am., Rept.* p. 137, pl. xlix. fig. 1 (1894).

Rostral nearly twice as broad as deep, just visible from above; internasals shorter than the præfrontals; frontal slightly longer than broad; loreal as long as deep or slightly longer than deep; one præ- and two postoculars; temporals 1+2; seven or eight upper labials, third and fourth or fourth and fifth entering the eye; anterior chin-shields as long as or a little shorter than the posterior. Scales in 19 rows. Ventrals 173-180; anal divided; subcaudals 85-89. Above with blackish cross bars separated by pale yellowish-brown interspaces; upper surface of head dark, nape yellowish; labials yellowish with blackish sutures; uniform yellowish white beneath.

Total length 560 millim.; tail 155.

Mexico.

- a-b. ♂ (V. 180, 173; C. 85, 89). Oaxaca. M. Sallé [C.]. (Types.)

5. *Hypsiglena latifasciata*.

Hypsiglena latifasciata, Günth. *Biol. C.-Am., Rept.* p. 138, pl. xlix. fig. 2 (1894).

Rostral nearly thrice as broad as deep, scarcely visible from above; internasals a little shorter than the præfrontals; frontal nearly twice as long as broad, with concave sides; loreal deeper than long; one præocular, with a small subocular below it; two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; anterior chin-shields shorter than the posterior. Scales in 21 rows. Ventrals 186; anal divided; subcaudals *circa* 80 (end of tail absent in the specimen). Dark brown above, with ten widely separated whitish cross bands; head whitish, spotted with brown, except on the occiput; beneath dirty white.

Total length 350 millim.

South Mexico.

- a. ♀ (V. 186; C. ?). S. Mexico. F. D. Godman, Esq. [P.]. (Type.)

6. *Hypsiglena ornata*.

Comastes ornatus, Bocourt, *Bull. Soc. Philom.* (7) viii. 1884, p. 141.

Hypsiglena ornata, Cope, *Bull. U.S. Nat. Mus.* no. 32, 1887, p. 78.

Scaling as in *H. torquata*, but body feebly compressed, ventrals and subcaudals more numerous, rostral smaller, and eye larger. Eight upper labials, fourth and fifth entering the eye. Ventrals 185-189; subcaudals 84-93. Yellowish above, with a dorsal series of large brown spots, and smaller spots alternating with them on the sides.

Total length 260 millim.; tail 87.

Isthmus of Darien.

90. RHINOCHILUS.

Rhinocheilus, *Baird & Gir. Cat. N. Am. Rept.* p. 120 (1853); *Cope, Proc. Ac. Philad.* 1860, p. 244; *Jan, Arch. Zool. Anat. Phys.* ii. 1863, p. 217; *Bocourt, Miss. Sc. Mex., Rept.* p. 602 (1886); *Cope, Proc. U.S. Nat. Mus.* xiv. 1892, p. 605.

Maxillary teeth 16 to 19, the two posterior largest; anterior mandibular teeth a little larger than the posterior. Head not distinct from neck, with pointed, strongly projecting snout; eye moderate, pupil round; rostral large. Body much elongate, cylindrical; scales smooth, with apical pits*, in 17 to 23 rows. Tail moderate; subcaudals entire, or only the posterior divided.

North America, Mexico, Venezuela.

Synopsis of the Species.

Scales in 23 rows	1. <i>lecontei</i> , p. 212.
Scales in 19 rows	2. <i>thominoti</i> , p. 213.
Scales in 17 rows	3. <i>antonii</i> , p. 213.

1. *Rhinochilus lecontei*.

Rhinocheilus lecontei, *Baird & Gir. Cat.* p. 120 (1853), and *Rep. U.S. Explor. R. R.* x. pt. iii. pl. xxxiii. fig. 90 (1859), and *U.S. Mex. Bound. Surv. ii. Rept.* pl. xx. (1859); *Jan, Arch. Zool. Anat. Phys.* ii. 1863, p. 217; *Cope, Proc. Ac. Philad.* 1866, p. 304; *Jan, Icon. Gén.* 48, pl. iii. fig. 1 (1876); *Garm. N. Am. Rept.* p. 73 (1883); *Bocourt, Miss. Sc. Mex., Rept.* p. 602, pl. xl. fig. 7 (1886); *Cope, Proc. U.S. Nat. Mus.* xiv. 1892, p. 606; *Günth. Biol. C.-Am., Rept.* p. 100 (1893).

Rostral as deep as broad, the portion visible from above at least half as long as its distance from the frontal; suture between the internasals as long as or a little longer than that between the præfrontals†; frontal a little longer than its distance from the end of the snout or than the parietals, twice as broad as the supraocular; loreal longer than deep; one or two præ- and two or three postoculars; temporals 2+2 or 2+3; eight upper labials, fourth and fifth entering the eye; three or four lower labials in contact with the anterior chin-shields; posterior chin-shields small, and separated from each other by two or three series of scales. Scales in 23 rows. Ventrals 191-206; anal entire; subcaudals 40-55. Black above, with brick-red square spots or cross bands; head and sides black and yellow; lower parts yellowish white, with black spots, at least on the sides.

Total length 940 millim.; tail 140.

California to Texas.

a, b, c. ♂ (V. 191, 205; Duval Co., Texas. W. Taylor, Esq. [C.].
C. 49, 50, 6 or 11 last
divided) & hgr. (V. 201;
C. 42, 8 last divided).

* Stated to be absent in *R. thominoti* and *antonii*.

† In spec. c the præfrontals are separated by the internasals, which are in contact with the point of the frontal.

d. Hgr. ♀ (V. 204; C. 46, San Diego, California. Prof. C. Eigenmann
11 last divided). [C.].

e. ♀ (V. 194; C. 42). California.

Var. *tessellatus*, Garm. l. c. p. 74.

Ventrals 178, subcaudals 37 entire and 14 pairs.

Coahuila, Mexico.

2. *Rhinochilus thominoti*.

Rhinocheilus thominotii, Bocourt, *Le Naturaliste*, (2) i. 1887, p. 45,
figs.

Portion of rostral visible from above about half as long as its distance from the frontal; suture between the internasals shorter than that between the præfrontals: frontal a little shorter than its distance from the end of the snout; loreal longer than deep; one præ- and two postoculars; temporals 2+3; eight upper labials, fourth and fifth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields nearly as large as the anterior and in contact with each other in front. Scales in 19 rows. Ventrals 181; anal entire; subcaudals 82, all single. Reddish yellow above; upper surface of head and a broad nuchal band brown; lower parts yellow.

Total length 280 millim.; tail 67.

Venezuela.

3. *Rhinochilus antonii*.

Rhinocheilus antonii, Dugès, *Proc. Am. Phil. Soc.* xxiii. 1886, p. 290, fig.,
and *Le Naturaliste*, (2) i. 1887, p. 46, and *La Naturelle*, (2) i. 1888,
p. 66, pl. vii.; Bocourt, *Miss. Sc. Mex., Rept.* pl. xlv. fig. 4 (1888).

Head-shields as in *R. lecontii*. Scales in 17 rows. Ventrals 200; anal entire; subcaudals 41, last three divided. Black above, with narrow yellow (red?) cross bands; lips yellow; belly yellow, checkered with black.

Total length 310 millim.; tail 35.

San Blas, near Mazatlan, Mexico.

91. CEMOPHORA.

— *copii*, *Jan, ll. cc.* fig. 3.

Portion of rostral visible from above as long as or a little longer than its distance from the frontal; suture between the internasals usually shorter than that between the præfrontals; frontal as long as broad or a little longer, longer than its distance from the end of the snout, as long as the parietals, at least twice as broad as the supraocular; loreal longer than deep; one or two præ- and one or two postoculars; temporals 1 + 2 (rarely 2 + 2); six or seven upper labials, second and third or third and fourth, or third only entering the eye; three or four lower labials in contact with the anterior chin-shields; posterior chin-shields small. Scales in 19 rows. Ventrals 157-188; anal entire; subcaudals 35-45. Red above (in life), with yellow or pale olive transverse bands between pairs of crescentic black bands; lower parts white.

Total length 660 millim.; tail 80.

South-eastern United States.

Synopsis of the Species.

I. Anal entire.

A. Portion of rostral seen from above as long as or a little shorter than its distance from the frontal.

1. Scales in 19 or 21 rows.

a. Two superposed anterior temporals; fifth or fourth and fifth labials usually entering the eye.

a. Four internasals; ventrals not angulate laterally.

1. *splendidus*, p. 217.

β. Two internasals; ventrals angulate laterally.

Suture between the internasals as long as or longer than that between the præfrontals; frontal large, considerably longer than its distance from the end of the snout

2. *purpurascens*, p. 218.

- Suture between the internasals as long as or shorter than that between the præfrontals; frontal moderate 3. *cyclurus*, p. 219.
- b. A single anterior temporal.
- Portion of rostral seen from above shorter than its distance from the frontal 4. *albocinctus*, p. 220.
- Portion of rostral seen from above as long as its distance from the frontal. 5. *formosanus*, p. 222.
2. Scales in 17 rows.
- a. Fourth and fifth labials entering the eye; a single anterior temporal. 6. *violaceus*, p. 222.
- b. Fourth or third and fourth labials entering the eye.
- α. A single labial entering the eye; a single anterior temporal 7. *woodmasoni*, p. 223.
- β. Two labials entering the eye; two superposed anterior temporals 8. *octolineatus*, p. 224.
- γ. Two labials entering the eye; a single anterior temporal.

1. *Simotes splendidus*.

Simotes splendidus, Günth. Proc. Zool. Soc. 1875, p. 231, pl. xxxiii.;
Bouleng. Faun. Ind., Rept. p. 310 (1890).

Nasal divided; portion of rostral seen from above as long as its distance from the frontal; each of the internasals broken up into two shields, there being four small shields in a transverse series; frontal longer than its distance from the end of the snout, slightly longer than the parietals; loreal deeper than long; præocular single, with a small subocular below it, between the third and fourth labials; two or three postoculars; temporals 2+3; eight upper labials, fourth and fifth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields about two thirds the length of the anterior. Scales in 21 rows. Ventrals 193; anal entire; subcaudals 41. Cream-colour, with sixteen large, brown, black-edged spots above, longer than the interspaces between them; these spots indented in front and behind, and with at least

a trace of a yellowish median line; the anterior spot is produced angularly to the posterior border of the frontal; the rest of the upper surface of the head speckled with dark brown; tail with a yellow vertebral line; an irregular series of small blackish spots along each abdominal edge, the lower surfaces being otherwise immaculate.

Total length 560 millim.; tail 65.

Southern India.

Nasal divided; portion of rostral seen from above as long as its distance from the frontal; suture between the internasals as long as or longer than that between the præfrontals; frontal large, considerably longer than its distance from the end of the snout, as long as or longer than the parietals; loreal as long as deep; one or two præoculars, with one or two suboculars below; two or three postoculars; temporals 2+3 or 2+2; usually eight upper labials, fourth and fifth entering the eye, or fourth excluded by the second subocular; four or five lower labials in contact with the anterior chin-shields, which are about twice as long as the posterior. Scales in 19 or 21 rows. Ventrals 160–210, angulate laterally; anal entire; subcaudals 40–60. Brown above, with darker, black-edged sinuous transverse bands, or with yellowish black-edged cross bars; a large arrow-headed dark-brown marking on the occiput and nape, with the apex on the frontal and usually confluent with a dark-brown chevron-shaped transverse band passing through the eyes; a dark oblique temporal streak; belly yellowish, with square blackish spots, which may be confined to the sides.

Total length 680 millim.; tail 110.

— *cyclurus*, *Bouleng. Faun. Ind., Rept.* p. 311 (1890); *W. L. Slater, Journ. As. Soc. Beng.* lx. 1890, p. 235.

Nasal divided; portion of rostral seen from above nearly as long as its distance from the frontal; suture between the internasals as long as or shorter than that between the præfrontals; frontal as long as its distance from the end of the snout or a little longer, and as long as the parietals; loreal as long as deep, or a little deeper than long; præocular single, usually with a small subocular below it, between the third and fourth labials; two postoculars; temporals 2+2; normally eight upper labials, fourth and fifth entering the eye; four, rarely three, lower labials in contact with the anterior chin-shields; posterior chin-shields one half or two thirds the length of the anterior. Scales in 19 or 21 rows. Ventrals 156-210, angulate laterally; anal undivided; subcaudals 37-58. Pale brown or greyish above, with or without four darker brown stripes, the median pair separated by the vertebral series of scales; antero-lateral border of some of the scales frequently black; markings on the head as in *S. albocinctus*; lower surfaces yellowish, uniform, or with squarish brown spots on each side below the angle of the

ventrals; these blotches may be subconfluent or form two chain-like series; subcaudals unspotted or with a few small scattered dots.

Total length 700 millim.; tail 100.

Bengal and Assam, Burma, Siam, Cochinchina, and Southern China.

6. *Simotes violaceus*.

- Coronella violacea*, *Cantor, Proc. Zool. Soc.* 1839, p. 50.
Simotes cinereus, *Günth. Rept. Brit. Ind.* p. 215 (1864).
 — *swinhonis*, *Günth. l. c.* pl. xx. fig. E.
 — *multifasciatus*, *Jan, Icon. Gén.* 12, pl. iv. fig. 2 (1865).
 — *semifasciatus*, *Anders. Journ. As. Soc. Beng.* xl. 1871, p. 16.
 — *violaceus*, *Bouleng. Faun. Ind., Rept.* p. 312 (1890).

Nasal divided; portion of rostral seen from above as long as its distance from the frontal or a little shorter; suture between the internasals usually shorter than that between the præfrontals; frontal as long as its distance from the end of the snout, as long as the parietals; loreal usually longer than deep; præocular single, usually with a small subocular below, between the third and fourth labials; one or two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; three or four lower labials in contact with the anterior chin-shields; posterior chin-shields one half or less than one half the size of the anterior. Scales in 17 rows. Ventrals 160–196; anal undivided; subcaudals 33–41. Pale brown, purplish or reddish above; markings on the head very indistinct.

Total length 760 millim.; tail 75.

Bengal, Assam, Burma, Camboja, Southern China.

A. Brown or reddish above, without dark markings; belly unspotted. (*S. violaceus*, *S. cinereus*.)

- a.* ♂ (V. 164; C. P). Camboja. M. Mouhot [C].
(Type of *S. cinereus*.)
b. ♂ (V. 169; C. 35). Toungyi, S. Shan States, Lieut. Blakeway [C].
5000 ft.

B. The black edges of some of the scales forming more or less distinct dark cross bands; belly unspotted. (*S. swinhonis*.)

- a.* ♂ (V. 161; C. 37). Amoy. R. Swinhoe, Esq. [C]. {
b-c. ♂ (V. 165; C. 39) —? Haslar Hospital. {

C. Intermediate between A and D.

- a.* ♂ (V. 172; C. 38). Tenasserim. Col. Beddome [C].

D. Above with more or less distinct dark cross bands; belly with quadrangular brown spots. (*S. multifasciatus*, *S. semifasciatus*.)

- a.* ♂ (V. 175; C. 38). Assam. W. T. Blanford, Esq.
[P].
b. ♂ (V. 171; C. 34). Toungyi, S. Shan States, Lieut. Blakeway [C].
5000 ft.

7. *Simotes woodmasoni*.

Simotes wood-masoni, W. L. Sclater, *Journ. As. Soc. Beng.* lx. 1891, p. 235, pl. vi. fig. 2.

Nasal divided; portion of the rostral seen from above a little shorter than its distance from the frontal; suture between the internasals shorter than that between the præfrontals; frontal longer than its distance from the end of the snout, as long as the parietals; loreal small, longer than deep; one præocular; one subocular, separating the third labial from the eye; two postoculars; temporals 1 + 2; six upper labials, the fourth alone entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields small. Scales in 17 rows. Ventrals strongly angulate, 180–186; anal undivided; subcaudals 57. Brick-reddish above, with traces of seven lighter stripes; head with a dark median longitudinal mark extending from the frontal to the nape, where it bifurcates, an oblique dark streak across the anterior nasal and the three anterior labials, a dark streak across the forehead through the eyes to the fourth and fifth labials, and an oblique dark streak across the parietals and the sides of the nape; dusky reddish beneath.

Andaman and Nicobar Islands.

8. *Simotes octolineatus*.

— *meyerinkii*, *Steindachn. Sitzb. Ak. Wien*, c. 1891, p. 294.

Nasal divided; portion of rostral seen from above a little shorter than its distance from the frontal; suture between the internasals nearly as long as that between the præfrontals; frontal longer than its distance from the end of the snout, as long as the parietals; loreal as long as deep; præocular single; two postoculars; temporals 2+2; six upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields about two thirds the length of the anterior. Scales in 17 rows. Ventrals obtusely angulate, 156–197; anal undivided; subcaudals 43–61. Yellow with six black longitudinal stripes, or blackish with yellow longitudinal lines, which are much narrower than the interspaces between them; head yellow, the two median dorsal bands meeting on the frontal; a black crescentic cross band anteriorly, passing through the eyes, and an oblique band on each side from the parietal shield to below the angle of the mouth; lower surfaces uniform or with a series of black spots on each side of the ventrals, sometimes confluent into a line.

Total length 680 millim.; tail 100.

Java, Borneo, Sooloo Islands, Sumatra, Malay Peninsula; Anamallay Hills, S. India.

Theob. Journ. Linn. Soc. x. 1868, p. 41; *Stoliczka, Proc. As. Soc.*
Beng. 1872, p. 145; *Bouleng. Faun. Ind., Rept.* p. 315 (1890).

Nasal divided; portion of rostral seen from above shorter than its distance from the frontal; suture between the internasals much shorter than that between the præfrontals; frontal as long as its distance from the end of the snout, slightly shorter than the parietals; loreal longer than deep, but usually shorter than in the preceding species; præocular single; two postoculars; temporals 1+2; eight (rarely seven) upper labials, fourth and fifth (or third and fourth) entering the eye: four or five lower labials in contact with the anterior chin-shields; posterior chin-shields about two thirds the length of the anterior. Scales in 17 rows. Ventrals 148-173; anal divided; subcaudals 27-37. Brown above, with four more or less distinct darker longitudinal lines; symmetrical dark markings on head broken up, rather indistinct in the adult, an oblique spot below the eye and a large patch on the occiput being distinguishable; lower surfaces yellowish (coral-red in life) with square black spots, at least on the posterior third of the belly; a large black spot at the base of the tail, and sometimes a second near the tip.

Total length 350 millim.; tail 45.

21. *Simotes torquatus*.

Simotes torquatus, *Bouleng. Ann. Mus. Genova*, (2) vi. 1888, p. 597, pl. v. fig. 1, and *Faun. Ind., Rept.* p. 316 (1890).

Nasal undivided; portion of rostral seen from above shorter than its distance from the frontal; suture between the internasals shorter than that between the præfrontals; frontal longer than its distance from the end of the snout and a little shorter than the parietals; loreal usually a little longer than deep; one præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields about two thirds the size of the anterior. Scales in 15 rows. Ventrals 144-159; anal divided; subcaudals 27-34. Grey-brown above, with four rather indistinct darker longitudinal streaks, replaced in the young by series of small blackish spots; upper surface of head with sometimes very indistinct symmetrical markings; a large dark brown (black in the young) spot below the eye, and a broad band of the same colour across the occiput, behind the parietal shields; lower parts white, usually with some black quadrangular spots on the posterior ventrals.

Total length 290 millim.; tail 38.

Upper Burma.

<i>a-b</i> . ♀ (V. 150; C. 31) & yg. (V. 144; C. 30).	Bhamo.	M. L. Fea [C.]. (Types.)

Simotes planiceps, *Bouleng. Ann. Mus. Genova*, (2) vi. 1888, p. 597, pl. v. fig. 2, and *Faun. Ind., Rept.* p. 316 (1890).

Head much depressed; nasal undivided; rostral very much produced above, entirely separating the internasals and wedged in between the præfrontals; frontal elongate, longer than its distance from the end of the snout and than the parietals; loreal longer than deep; one præ- and two postoculars; temporals 1+1; five upper labials, third entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields hardly half as large as the anterior. Scales in 13 rows. Ventrals 132; anal divided; subcaudals 27. Pale brown above, with small oblique black markings occupying the anterior outer border of some of the scales; a black cross band on the occiput, behind the parietals; upper lip yellow, with an oblique black streak below the eye, crossing the suture between the third and fourth upper labials;

lower parts pinkish, with square black spots mostly arranged in pairs.

Total length 130 millim.; tail 15.

Minhla, Burma.

93. OLIGODON.

Oligodon, *Boie, Isis*, 1827, p. 519; *Wagler, Syst. Amph.* p. 191 (1830); *Dum. & Bibr. Erp. Gén.* vii. p. 54 (1854); *Günth. Cat. Col. Sn.* p. 20 (1858); *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 36; *Günth. Rept. Brit. Ind.* p. 205 (1864); *Bouleng. Faun. Ind., Rept.* p. 317 (1890).

Calamaria, part., *Schleg. Phys. Serp.* ii. p. 25 (1837).

Homalosoma, part., *Jan, l. c.* p. 33.

Rhynchocalamus, *Günth. Proc. Zool. Soc.* 1864, p. 491.

Tripeltis, *Cope, Proc. Amer. Philos. Soc.* xxiii. 1886, p. 487.

Characters of *Simotes*, but maxillary teeth fewer still (6 to 8), and no pterygoid teeth, the palate being entirely edentulous or with two or three teeth on each palatine. Scales in 15 or 17 rows.

Southern Asia; Lower Egypt.

This genus may have to be united with the preceding, *S. venustus*, being, as pointed out by Dr. Günther (*Ann. & Mag. N. H.* (4) i. 1868, p. 416), intermediate between *Simotes* and *Oligodon*.

Synopsis of the Species.

I. Scales in 17 rows.

A. Anal divided; no loreal shield; two postoculars.

Portion of rostral seen from above as long as, or a little shorter than, its distance from the frontal; latter shield as long as the parietals. 1. *venustus*, p. 235.

Portion of rostral seen from above as long as or a little shorter than its distance from the frontal; latter shield shorter than the parietals. 2. *travancoricus*, p. 236.

Portion of rostral seen from above much shorter than its distance from the frontal 3. *affinis*, p. 236.

B. Anal entire; loreal usually present.

Two postoculars; subcaudals 35-46 . . . 4. *bitorquatus*, p. 237.

One postocular; subcaudals 52-62 . . . 5. *trilineatus*, p. 238.

II. Scales in 15 rows.

A. Anal entire.

1. Nasal divided.

One postocular; no loreal; only the third upper labial entering the eye. . . 6. *modestus*, p. 238.

One postocular; loreal present; third and fourth labials entering the eye

7. *notospilus*, p. 239.

Two postoculars; loreal present.....

8. *everetti*, p. 239.

2. Nasal undivided; two postoculars

9. *propinquus*, p. 240.

B. Anal divided.

1. Nasal divided.

a. No internasals..... 10. *brevicauda*, p. 240.

b. A pair of internasals.

a. A single postocular..... 11. *dorsalis*, p. 241.

β. Two postoculars.

* Ventrals not more than 160, subcaudals not more than 35.

Portion of rostral seen from above about half as long as its distance from the frontal

12. *templetonii*, p. 241.

Portion of rostral seen from above measuring about two thirds its distance from the frontal

13. *sublineatus*, p. 242.

Portion of rostral seen from above as long as its distance from the frontal.

14. *elliotti*, p. 242.

** Ventrals 154 or more, subcaudals more than 35.

Portion of rostral seen from above as long as or a little shorter than its distance from the frontal.....

15. *subgriseus*, p. 243.

Portion of rostral seen from above considerably shorter than its distance from the frontal

16. *vertebralis*, p. 245.

2. Nasal undivided.

Two postoculars; six upper labials; ventrals 145-151

17. *waandersii*, p. 245.

One postocular; seven upper labials; ventrals 181-229

18. *melanocephalus*, p. 246.

Oligodon dorsale, Berthold, Götting. Nachr. 1859, p. 179, stated to be from Bengal, perhaps belongs to a different genus. It is described as:—"Grey above, with a white median line, and a curved brown interocular band; white beneath; rostral shield large; scales rhomboidal, smooth, in 13 rows; ventrals 183, anal single, subcaudals 46; tail one fifth of total length."

TABLE SHOWING NUMBERS OF SCALES AND SHIELDS.

	Sc.	V.	A.	C.	Lab.
<i>venustus</i>	17	143-162	2	28-36	7 (6)
<i>transancticus</i>	17	145-151	2	35-37	7

<i>subgriseus</i>	15	158-218	2	38-56	7
<i>vertebralis</i>	15	154	2	54	7
<i>saundersii</i>	15	145-151	2	22-28	6
<i>melanocephalus</i>	15	181-229	2	53-68	7

1. *Oligodon venustus*.

Oligodon venustus, Jordan, *Journ. As. Soc. Beng.* xiii. 1853, p. 528;

Bouleng. *Faun. Ind., Rept.* p. 317 (1890).

Simotes binotatus (non D. & B.), Günth. *Cat.* p. 24 (1858).

— *venustus*, Günth. *Rept. Brit. Ind.* p. 213 (1864), and *Ann. & Mag. N. H.* (4) i. 1868, p. 416.

Nasal divided; portion of rostral seen from above as long as its distance from the frontal or a little shorter; suture between the internasals shorter than that between the prefrontals; frontal longer than its distance from the end of the snout, as long as the parietals; no loreal, the posterior nasal sometimes forming a suture with the præocular; præocular single; two postoculars; temporals 1+2; usually seven (rarely six) upper labials, third and fourth entering the eye, sixth frequently excluded from the labial border and taking the position of a lower anterior temporal; four lower labials in contact with the anterior chin-shields; posterior chin-shields one half to two thirds the length of the anterior. Scales in 17 rows. Ventrals 143-162; anal divided; subcaudals 28-36. Pale brown or greyish above, with a series of paired large oval or rhomboidal blackish spots edged with yellowish, which are usually united mesially; a large, more irregular spot below each dorsal spot; head-markings consisting of a crescentic anterior cross band, passing through the eye, an oblique band on each side, from the parietal to below the angle of the mouth, and a broad angular band on the nape; top of head frequently with black vermiculations. Lower surfaces black and yellow, the two colours in nearly equal proportions, except under the tail, where the yellow predominates, or where sometimes black spots are entirely wanting.

Total length 480 millim.; tail 65.

South-western India.

2. *Oligodon travancoricus*. (PLATE X. fig. 2.)

Oligodon travancoricus, Beddome, *Proc. Zool. Soc.* 1877, p. 685; *Bouleng. Faun. Ind., Rept.* p. 318 (1890).

Nasal divided; portion of rostral seen from above as long as or a little shorter than its distance from the frontal; suture between the internasals shorter than that between the præfrontals; frontal as long as or longer than its distance from the end of the snout, shorter than the parietals; no loreal, the posterior nasal forming a suture with the præocular, or the præfrontal forming a suture with the second labial; præocular single; two postoculars; temporals 1+2 or 2+3; upper labials seven, third and fourth entering the eye, sixth excluded from the labial margin; three lower labials in contact with the anterior chin-shields; posterior chin-shields two thirds the length of the anterior. Scales in 17 rows. Ventrals 145-151; anal divided; subcaudals 35-37. Greyish or pale brown above, with 25 to 33 black or dark brown, light-edged cross bands on the body, and five or six pairs of spots on the tail; three broad black, light-edged transverse bands on the head, viz., a frontal, an occipital, and a nuchal, connected or not longitudinally on the median line; a small white spot may be present in the middle between the parietals. Lower surfaces white, with large square black spots.

Total length 450 millim.; tail 65. I have examined a specimen belonging to the Trevandrum Museum, which measures 465 millim.; tail 65.

Travancore hills.

- a. Hgr. ♂ (V. 145; C. 37). Tinnevely hills. Col. Beddome [C.] (Type.)
 b-c. ♂ (V. 147, 146; C. 37, 35). High Range, Travancore. H. S. Ferguson, Esq. [P.]

3. *Oligodon affinis*.

Oligodon affinis, Günth. *Ann. & Mag. N. H.* (3) ix. 1862, p. 53, and *Rept. Brit. Ind.* p. 209, pl. xix. fig. B (1864); *Bouleng. Faun. Ind., Rept.* p. 318 (1890).

Nasal divided; portion of rostral seen from above half as long

as its distance from the frontal; suture between the internasals as long as that between the præfrontals, or a little shorter; frontal much longer than its distance from the end of the snout, as long as the parietals; no loreal, the posterior nasal sometimes forming a suture with the præocular; præocular single; two postoculars; temporals 1+2, or 1+1+2; upper labials seven, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields about two thirds the length of the anterior. Scales in 17 rows. Ventrals 129-142; anal divided; subcaudals 25-36. Brown above, with more or less distinct darker cross lines; head with dark symmetrical transverse markings, which are usually connected by a median longitudinal streak. Lower surfaces white (in spirit) with square black spots, both colours being distributed in nearly equal proportion.

Total length 330 millim.; tail 50.

South-western India.

Rabdosoma amboinense, *Bleek. Nat. Tijdschr. Nederl. Ind.* xxii. 1860, p. 42.

Nasal divided; portion of rostral seen from above shorter than its distance from the frontal; suture between the internasals shorter than that between the præfrontals; frontal longer than its distance from the end of the snout, as long as or a little shorter than the parietals; loreal usually present, a little longer than deep; one præ- and two postoculars; temporals 1+2 or 2+2; seven upper labials, third and fourth entering the eye; three or four lower labials in contact with the anterior chin-shields; posterior chin-shields one half to two thirds the length of the anterior. Scales in 17 rows. Ventrals 140-155; anal entire; subcaudals 35-46. Purplish brown or blackish above, with yellow (or red) dots and usually a vertebral series of larger spots; head with symmetrical blackish markings and one or two chevron-shaped yellowish bands, the second on the occiput and nape; belly red, with quadrangular or transverse black spots.

Total length 370 millim.; tail 67.

Simotes trilineatus, Dum. & Bibr. vii. p. 636 (1854); *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 324, and *Icon. Gén.* 12, pl. iv. fig. 1 (1865).

Oligodon trilineatus, Fischer, *Abh. naturw. Ver. Hamb.* ix. 1885, p. 7.

Nasal divided; portion of rostral seen from above nearly as long as its distance from the frontal; suture between the internasals nearly as long as that between the præfrontals; frontal longer than its distance from the end of the snout, as long as the parietals; loreal small, longer than deep; one præ- and one postocular; temporals 1+2 or 2+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are nearly twice as long as the posterior. Scales in 17 rows. Ventrals 145-157; anal entire; subcaudals 52-62. Dark brown or blackish above and below; head yellowish brown, with blackish oblique bands interrupted on the crown; a yellow vertebral stripe, a fine yellowish line along each side of the back, and a white line along each side of the belly.

Total length 330 millim.; tail 80.

Pulo Nias.

- a-b. ♀ (V. 147; C. 60) Nias. Herr Sundermann [C.].

(Type.)
b. ♂ (V. 170; C. 41). S. Negros. A. Everett, Esq. [C.]

7. *Oligodon notospilus*.

Oligodon notospilus, Günth. *Proc. Zool. Soc.* 1873, p. 169, pl. xviii.
fig. A.

Nasal divided; portion of rostral seen from above shorter than its distance from the frontal; suture between the internasals shorter than that between the præfrontals; frontal longer than its distance from the end of the snout, as long as the parietals; loreal very small, longer than deep; one præ- and one postocular; temporals 1+2; seven upper labials, third and fourth entering the eye; three lower labials in contact with the anterior chin-shields, which are a little longer than the posterior. Scales in 15 rows. Ventrals 142; anal entire; subcaudals 32. Dark purplish brown above, with yellow dots and a series of large transverse, rhomboidal, yellow, black-edged spots; head yellow, with two chevron-shaped black bands, the anterior passing through the eyes, the posterior with the point on the frontal shield; uniform yellowish inferiorly.

Total length 260 millim.; tail 40.

Philippine Islands.

- a. ♀ (V. 142; C. 32). Mindanao. Dr. A. B. Meyer [C.]
(Type.)

8. *Oligodon everetti*. (PLATE XI. fig. 1.)

Oligodon everetti, Bouleng. *Proc. Zool. Soc.* 1893, p. 524.

Nasal divided; portion of rostral seen from above slightly shorter than its distance from the frontal; suture between the internasals shorter than that between the præfrontals; frontal longer than its distance from the end of the snout, slightly shorter than the parietals; loreal very small, longer than deep; one præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are longer than the posterior. Scales in 15 rows. Ventrals 154; anal entire; subcaudals 46. Slaty grey above, with three blackish-brown stripes, the middle one three scales wide and enclosing a series of small yellowish-brown rhomboidal spots; head brown above, with two chevron-shaped black bands, the anterior passing through the eyes, the posterior with the point on the frontal shield; uniform coral-red beneath, the outer ends of the ventral shields black.

Total length 370 millim.; tail 70.

North Borneo.

- a. ♀ (V. 154; C. 46). Mt. Kina Baloo. A. Everett, Esq. [C.]
(Type.)

9. *Oligodon propinquus*.

Oligodon propinquus, Jan, *Arch. Zool. Anat. Phys.* ii. 1862, p. 38, and *Icon. Gén.* 48, pl. i. fig. 1 (1876).

Nasal undivided; portion of rostral seen from above a little shorter than its distance from the frontal; suture between the internasals longer than that between the præfrontals; frontal longer than its distance from the end of the snout, as long as the parietals; loreal small, a little longer than deep; one præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are a little longer than the posterior. Scales in 15 rows. Ventrals 140; anal entire; subcaudals 27. Black above, with yellowish dots; a series of small yellowish spots along the back; belly whitish.

Total length 285 millim.; tail 40.

Java.

10. *Oligodon brevicauda*.

Oligodon brevicauda, Günth. *Ann. & Mag. N. H.* (3) ix. 1862, p. 58, and *Rept. Brit. Ind.* p. 211, pl. xix. fig. A (1864); *Bouleng. Faun. Ind., Rept.* p. 319 (1890).

Nasal divided; portion of rostral seen from above longer than its distance from the frontal; no internasals; frontal longer than its distance from the end of the snout, as long as the parietals; no loreal, the posterior nasal forming a suture with the præocular; præocular single; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields about two thirds the length of the anterior. Scales in 15 rows. Ventrals 164-173; anal divided; subcaudals 25-29. Brown above, with a light vertebral band, most marked posteriorly, bordered on each side by a dark brown or black band; a black narrow streak along each side; a rhomboidal dark spot on the frontal, confluent with a broad crescentic transverse band anteriorly, which passes through the eyes; a dark band from behind the eye to the angle of the mouth; a large dark nuchal spot. Lower surface red, with large quadrangular or transverse black spots; tail without, or with only a few, black spots. Spec. *d* very dark, almost black above and below, the black markings being just distinguishable.

Total length 480 millim.; tail 50.

South-western India.

11. *Oligodon dorsalis*.

Elaps dorsalis, Gray, *Ill. Ind. Zool.* ii. pl. lxxxv. fig. 1 (1834).

Oligodon dorsalis, Günth. *Cat.* p. 22 (1858), and *Rept. Brit. Ind.* p. 210 (1864); *Anders. Proc. Zool. Soc.* 1871, p. 168; *Bouleng. Faun. Ind., Rept.* p. 319 (1890).

Nasal divided; portion of rostral seen from above shorter than its distance from the frontal; suture between the internasals as long as that between the præfrontals or shorter; frontal longer than its distance from the end of the snout, as long as the parietals; loreal as long as deep; præocular single; postocular single; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields about two thirds the length of the anterior. Scales in 15 rows. Ventrals 174-188; anal divided; subcaudals 37-51. Brown above, with a yellowish vertebral streak, on each side of which is a series of small black spots; a black lateral streak; a large subtriangular blackish spot on the forehead, connected with a very large occipital spot by a longitudinal streak on the frontal; lower surfaces black and yellow (in spirit), the black predominating on the belly, the yellow on the tail.

Total length 360 millim.; tail 65.

Khasi, Naga, and Chittagong hills.

12. *Oligodon templetonii*.

Oligodon templetonii, Günth. *Ann. & Mag. N. H.* (3) ix. 1862, p. 57, and *Rept. Brit. Ind.* p. 209, pl. xix. fig. C (1864); *Bouleng. Faun. Ind., Rept.* p. 320 (1890).

Nasal divided; portion of rostral seen from above about half as long as its distance from the frontal; suture between the internasals longer or shorter than that between the præfrontals; frontal much longer than its distance from the end of the snout, as long as the parietals; loreal longer than deep, sometimes entering the eye; præocular single; two or three postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye, sixth usually excluded from the labial border; three or four lower labials in contact with the anterior chin-shields; posterior chin-shields about two thirds the length of the anterior. Scales in 15 rows. Ventrals 135-152; anal divided; subcaudals 28-31. Brown above, with a yellowish vertebral streak, which becomes more distinct on the tail, and is crossed by about eighteen narrow dark brown bands; head-markings very indistinct except an oblique band below the eye; lower surfaces white with square black spots, both colours being distributed in nearly equal proportion.

Total length 270 millim.; tail 40.

Nasal divided; portion of rostral seen from above shorter than its distance from the frontal; suture between the internasals nearly as long as that between the præfrontals; frontal longer than its distance from the end of the snout, as long as the parietals, or slightly longer; loreal as long as deep, or a little longer, rarely absent; præocular single; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; three or four lower labials in contact with the anterior chin-shields; posterior chin-shields about two thirds the length of the anterior. Scales in 15 rows. Ventrals 136-160; anal divided; subcaudals 26-35. Pale brown above, some of the scales edged with dark brown; frequently a more or less regular series of paired dark brown dorsal spots; head with dark brown markings; an angular transverse band anteriorly, passing through the eyes; a longitudinal band from the middle of the frontal to a little beyond the parietals, and a large spot on each side of the nape; the longitudinal band and the nuchal spots sometimes confluent; lower surfaces yellowish, with three (rarely two) longitudinal series of small dark brown spots, the lateral series often confluent into a line.

Total length 315 millim.; tail 35.

Upper head-shields as in *P. meleagris*; two præ- and two or three postoculars; temporals 1+2; six upper labials, third and fourth entering the eye. Scales keeled, in 17 rows. Ventrals 117; anal entire; subcaudals 32. Pale reddish brown above; the greater part of the upper surface of the head and nape black, leaving a pale spot on each supraocular and a cordiform one on the middle of the nape; a black cross bar on the neck, followed by a double series of black spots along the anterior two thirds of the back; yellowish white inferiorly.

Total length 180 millim.; tail 32.

Inhambane, Mozambique.

95. LEPTOCALAMUS.

Leptocalamus, *Günth. Ann. & Mag. N. H.* (4) ix. 1872, p. 16.

Enulius (non Cope), *Bocourt, Miss. Sc. Mex., Rept.* p. 536 (1883).

Maxillary very short, not extending forwards beyond the anterior extremity of the palatines, with 4 or 5 small teeth, followed, after an interspace, by a very large, compressed, blade-like fang; mandibular teeth small, equal: teeth on palatines and pterygoids few. Head not or but slightly distinct from neck; snout depressed, strongly projecting; eye small, with round pupil; nostril between two nasals; loreal (or loreal and præfrontal) entering the eye. Body cylindrical,

elongate; scales smooth, with apical pits, in 15 or 17 rows; ventrals rounded. Tail long, ending obtusely; subcaudals in two rows.

Tropical America.

Synopsis of the Species.

- Scales in 17 rows; portion of rostral visible from above one half or three fifths its distance from the frontal; frontal as long as its distance from the end of the snout; præfrontal entering the eye. 1. *torquatus*, p. 250.
- Scales in 17 rows; upper portion of rostral as long as its distance from the frontal; frontal longer than its distance from the end of the snout; a small præocular 2. *sumichrasti*, p. 250.
- Scales in 15 rows; upper portion of rostral about one third its distance from the frontal; frontal longer than its distance from the end of the snout; præfrontal entering the eye 3. *sclateri*, p. 251.

1. *Leptocalamus torquatus*.

- Leptocalamus torquatus*, Günth. *Ann. & Mag. N. H.* (4) ix. 1872, p. 17, pl. iii. fig. A.
Geophis unicolor, Fischer, *Abh. naturw. Ver. Bremen*, vii. 1880, p. 227, pl. xv. figs. 1-3.
Enulius murinus (non Cope), Bocourt, *Miss. Sc. Mex., Rept.* p. 537, pl. xxxv. fig. 9 (1883).
Leptocalamus unicolor, Cope, *Proc. Amer. Philos. Soc.* xxii. 1885, p. 178; Günth. *Biol. C.-Am., Rept.* p. 100 (1893).
Geagras longicaudatus, Cope, *Am. Nat.* 1884, p. 162.

Rostral large, broad, the portion visible from above one half or three fifths its distance from the frontal; internasals shorter than the præfrontals, which largely enter the eyes; frontal large, as long as broad, as long as its distance from the end of the snout, a little shorter than the parietals; supraocular very small; loreal as long as the nasals; no præocular; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; a single pair of small chin-shields. Scales in 17 rows. Ventrals 177-203; anal divided; subcaudals 90-102. Pale reddish brown above, uniform or with a yellow band across the occiput; lower parts uniform yellowish.

Total length 305 millim.

Mexico.

♂ (V. 183; C. ?).

S. America (?).

(Type.)

2. *Leptocalamus sumichrasti*.

- Enulius sumichrasti*, Bocourt, *Miss. Sc. Mex., Rept.* p. 538, pl. xxxi. fig. 6 (1883).
Geagras sumichrasti, Cope, *Am. Nat.* 1884, p. 162.

Snout shorter than in *L. torquatus*; upper portion of rostral as long as its distance from the frontal; præfrontal separated from the eye by a small præocular. Scales in 17 rows. Ventrals 191; subcaudals 93. Uniform grey-brown above, yellowish white beneath.

Total length 346 millim.; tail 105.

Isthmus of Tehuantepec.

3. *Leptocalamus sclateri*. (PLATE XII. fig. 1.)

Rostral smaller than in *L. torquatus*, nearly twice as broad as deep, the portion visible from above measuring about one third its distance from the frontal; internasals shorter than the præfrontals, which largely enter the eyes; frontal large, kite-shaped, slightly longer than broad, much longer than its distance from the end of the snout, as long as the parietals; supraocular very small; loreal longer than the nasals; no præocular; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; five small equal chin-shields, the anterior a pair in contact with three labials. Scales in 15 rows. Ventrals 144; anal divided; subcaudals 98. Uniform dark brown above; head yellow, with a black blotch on the snout and another round each eye; lower parts uniform yellowish.

Total length 380 millim.; tail 150.

S. America.

a. ♀ (V. 144; C. 98).

96. ARRHYTON.

Arrhyton, *Günth. Cat. Col. Sn.* p. 244 (1858).

Cryptodacus, *Gundl. & Peters, Mon. Berl. Ac.* 1861, p. 1002; *Bocourt, Miss. Sc. Mex., Rept.* p. 560 (1883).

Colorhogia, *Cope, Proc. Ac. Philad.* 1862, p. 81.

Maxillary bone short, with 8 small teeth, followed, after a considerable interspace, by a strongly enlarged fang; palatine and pterygoid teeth few; mandibular teeth small, equal. Head slightly distinct from neck; eye rather small, with round pupil; nasal entire or semidivided. Body cylindrical, moderately elongate; scales smooth, without apical pits, in 15 or 17 rows; ventrals rounded. Tail moderate; subcaudals in two rows.

Cuba.

Synopsis of the Species.

2. *Arrhyton vittatum*.

Cryptodacus vittatus, *Gundl. & Peters, Mon. Berl. Ac.* 1861, p. 1002; *Cope, Proc. Ac. Philad.* 1862, p. 339; *Gundl. Repert. Fis.-Nat. Cuba*, ii. 1866, p. 116; *Bocourt, Miss. Sc. Mex., Rept.* p. 561, pl. xxxv. fig. 7 (1883).

Arrhyton bivittatum, *Cope, Proc. Acad. Philad.* 1862, p. 82.

Rostral twice as broad as deep, visible from above; nasal undivided; suture between the internasals shorter than that between the præfrontals; frontal as long as broad or a little longer, much broader than the supraocular, as long as its distance from the end of the snout, a little shorter than the parietals; loreal square or longer than deep; one præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are as long as or longer than the posterior. Scales in 15 or 17 rows. Ventrals 115-116; anal divided; subcaudals 64-73. Yellowish above, with three brown longitudinal lines, the median sometimes indistinct; yellowish white inferiorly.

Total length 297 millim.; tail 105.

Cuba.

3. *Arrhyton redimitum*.

Colorhogia redimita, *Cope, Proc. Ac. Philad.* 1862, p. 81.

Cryptodacus redimitus, *Bocourt, Miss. Sc. Mex., Rept.* p. 561, pl. xxxv. fig. 8 (1883).

Nasal undivided; præfrontals fused to a single shield; frontal broad, as broad as long, shorter than the parietals; loreal longer

than deep; one præ- and one postocular; temporals 1+2; seven upper labials, third and fourth entering the eye; anterior chin-shields longer than the posterior. Scales in 17 rows. Ventrals 141; anal divided; subcaudals 120. Pale grey-brown above, with three darker longitudinal streaks; lips and lower parts yellowish white.

Total length 390 millim.; tail 90.

Cuba.

97. SIMOPHIS.

Rhinostoma, part., *Fitzing. N. Class. Rept.* p. 29 (1826); *Günth. Cat. Col. Sn.* p. 8 (1858).

Prof. C. Machado [P.].

2. *Simophis rohdii*.

Rhinaspis rohdei, Boettg. *Zeitschr. f. Naturw.* (4) iv. 1885, p. 231.

Distinguished from the preceding in having the rostral more pointed behind, forming a right angle; eight upper labials, fourth and fifth entering the eye; and scales in 17 rows. Ventrals 171; anal divided; subcaudals 67. Coloration same as in *S. rhinostoma*. Total length 730 millim.; tail 140.

Paraguay.

98. SCAPHIOPHIS.

Scaphiophis, Peters, *Mon. Berl. Ac.* 1870, p. 644.

Maxillary teeth very small, subequal, 12 or 13 on each side; mandibular teeth small, subequal. Head short, rarely distinct from neck, with broad, beak-shaped, hooked snout; rostral very large, with sharp horizontal edge, concave inferiorly; nostril a curved slit between two nasals; a series of suboculars; eye moderate, with round pupil. Body elongate; scales smooth, with apical pits, in 21 series or more; ventrals rounded. Tail moderate or rather short; subcaudals in two rows, or the anterior single.

Tropical Africa.

1. *Scaphiophis albopunctatus*.

Scaphiophis albopunctatus, Peters, *Mon. Berl. Ac.* 1870, p. 645, pl. i. fig. 4; Bocourt, *Ann. Sc. Nat.* (6) ii. 1875, art. 3; Fischer, *Jahrb. Hamb. Wiss. Anst.* ii. 1885, p. 100, pl. iii. fig. 6; Bocage, *Jorn. Sc. Lisb.* xi. 1887, p. 195; Mocquard, *Bull. Soc. Philom.* (7) xi. 1887, p. 77.

— raffreyi, Bocourt, *l. c.*

The upper surface of the rostral once and a half to twice as long as its distance from the frontal; internasals and præfrontals broad, the former as long as or a little shorter than the latter; frontal a little longer than broad, nearly twice as broad as the supraocular; parietals broken up into four shields or more; usually two small superposed loreals; one præ- and two postoculars; three suboculars, separating the eye from the labials; temporals small, scale-like; five upper labials, fifth very long; a single pair of large chin-shields, in contact with three lower labials on each side. Scales in 25 to 31 rows on the neck, 21 to 25 on the middle of the body. Ventrals 210–240; anal divided; subcaudals 51–65. Pale brown above, uniform or spotted with black, or with whitish dots; lower parts white.

Total length 960 millim.; tail 160.

Tropical Africa, from the coast of Guinea and the Congo to the Upper Nile and Abyssinia.

Maxillary teeth small, equal or subequal, 12 to 20; mandibular teeth subequal. Head small, not or but slightly distinct from neck; eye small or moderate, with round or vertically subelliptic pupil; nasal often single or semidivided; loreal sometimes absent; internasals sometimes fused with the præfrontals. Body cylindrical; scales smooth or keeled, with apical pits, in 13 to 19 rows; ventrals rounded. Tail short, moderate or long; subcaudals in two rows.

South-western Asia and Sind; America.

Synopsis of the Species.

I. Rostral shield moderate.

A. Scales keeled, in 15 rows; ventrals 148-166; subcaudals 111-148..... 1. *astiva*, p. 258.

B. Scales smooth.

1. Nasal entire (exceptionally semidivided).

a. Seven upper labials; portion of rostral visible from above not more than half as long as its distance from the frontal.

a. Ventrals 103-148.

Scales in 15 rows; subcaudals 65-94 2. *vernalis*, p. 258.

Scales in 13 rows; subcaudals 51-64 3. *agassizii*, p. 259.

Scales in 15 to 19 rows; subcaudals 24-52. 11. *coronella*, p. 264.

β. Ventrals 150-235; subcaudals 48-85; scales in 15 or 17 rows.

* Rostral as deep as broad or a little broader than deep; scales in 15 or 17 rows; ventrals 150-191.
Frontal at least twice as long as broad .. 4. *decemlineata*, p. 260
Frontal not twice as long as broad 5. *collaris*, p. 260.

** Rostral considerably broader than deep; scales in 15 rows.

† Frontal as long as the parietals; ventrals 158-171.
6. *fasciata*, p. 262.

†† Frontal much shorter than the parietals.

Frontal once and two thirds as long as broad; ventrals 186 7. *angusticeps*, p. 262.

Frontal not once and a half as long as broad; ventrals 159-187 8. *rothi*, p. 262.

Frontal once and a half as long as broad, about once and a half as broad as the supraocular; ventrals 194-216 9. *persica*, p. 263.

Frontal once and a half as long as broad, nearly twice as broad as the supraocular; ventrals 211-235 10. *walteri*, p. 263.

b. Seven upper labials; portion of rostral visible from above measuring one half to two thirds its distance from the frontal.

a. Scales in 13 rows; ventrals 126-137; subcaudals 37-46 12. *taylori*, p. 265.

β. Scales in 15 rows.

* Body without black cross bars.

Ventrals 145-163 13. *episcopa*, p. 265.

Ventrals 183 14. *torquata*, p. 266.

** Body with black cross bars.

Ventrals 158-167; subcaudals 50-52 15. *isozona*, p. 266.

Ventrals 147-158; subcaudals 34-44 16. *occipitalis*, p. 266.

- c. Eight upper labials; ventrals 133; subcaudals 50; scales in 17 rows 17. *pachyura*, p. 267.
2. Nasal divided or semidivided; scales in 15 rows; ventrals 147-167; subcaudals 29-39.
- Two postoculars 18. *mitis*, p. 267.
- Three postoculars 19. *semiannulata*,
[p. 268.]
- II. Rostral large, the portion seen from above as long as or a little shorter than its distance from the frontal; scales in 17 rows.
- Nasal entire or semidivided; ventrals 110-137; subcaudals 23-40 20. *nasus*, p. 268.
- Nasal divided; ventrals 141-160; subcaudals 38-48 21. *frontalis*, p. 270.

Liopeltis vernalis, *Cope, Proc. Ac. Philad.* 1860, p. 560; *Jan, Icon. Gén.* 31, pl. v. fig. 3 (1869).

Rostral broader than deep, the portion visible from above nearly half as long as its distance from the end of the snout; nasal undivided; suture between the internasals shorter than that between the præfrontals; frontal nearly once and a half as long as broad, longer than its distance from the end of the snout, shorter than the parietals; loreal small, square, or a little deeper than long, or a little longer than deep, rarely united with the nasal; one (rarely two) præ- and two postoculars; temporals 1+2 (rarely 1+1); seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields longer than the anterior, and in contact anteriorly. Scales in 15 rows. Ventrals 119-148; anal divided; subcaudals 65-94. Uniform green above, upper lip and lower parts yellowish or greenish white.

Total length 450 millim.; tail 160.

North America, east of the Rocky Mountains.

Rostral a little broader than deep, just visible from above; nasal undivided; suture between the internasals as long as or a little shorter than that between the præfrontals; frontal once and a half to once and two thirds as long as broad, longer than its distance from the end of the snout, shorter than the parietals; loreal square or a little longer than deep; one (rarely two) præ- and two (rarely one) postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four (rarely five) lower labials in contact with the anterior chin-shields; posterior chin-shields smaller than the anterior, and usually separated from each other by scales. Scales in 15 or 17 rows. Ventrals 150–191; anal divided; subcaudals 50–78. Pale olive above, each scale lighter in the centre; head and nape in the young black, with yellow spots or cross bands, the black nuchal collar edged with yellow; these markings becoming indistinct in the adult; lower parts uniform white. Some varieties have longitudinal series of dark dots, which may form lines on the tail.

Total length 480 millim.; tail 110.

From the Archipelago, Cyprus, and Asia Minor to the Caucasus and Persia.

Eirenis fasciatus, Jan, *Arch. Zool. Anat. Phys.* ii. 1863, p. 260, and *Icon. Gén.* 15, pl. v. fig. 2 (1866).

Cyclophis fasciatus, Blanf. *Zool. E. Pers.* p. 406 (1876); *Boettg. Zool. Jahrb.* iii. 1888, p. 920.

Ablabes fasciatus, *Boettg. Ber. Senck. Ges.* 1879-80, p. 142.

Rostral broader than deep; nasal undivided; frontal as long as its distance from the end of the snout, as long as the parietals; loreal very small, as long as deep; one præ- and two postoculars; temporals 1+2 or 1+1; seven upper labials, third and fourth entering the eye; chin-shields small, posterior separated by a scale. Scales in 15 rows. Ventrals 158-171; anal divided; subcaudals 48-62. Sandy grey above, with numerous narrow cross bands of brownish olive, breaking up into spots on the posterior third of the body and on the tail; belly salmon-colour in life, the anterior portion of each ventral shield brown near the sides.

Total length 340 millim.; tail 82.

Syria, Persia, Transcaspia.

7. *Contia angusticeps*.

Head narrow and elongate. Rostral twice as broad as deep, just visible from above; nasal undivided; suture between the internasals longer than that between the præfrontals; frontal once and two thirds as long as broad, hardly once and a half as broad as the supraocular, longer than its distance from the end of the snout, much shorter than the parietals; a very small loreal, longer than deep; one præ- and one postocular; temporals 1+1; seven upper labials, third and fourth entering the eye; five lower labials in contact with the anterior chin-shields, which are a little longer than the posterior. Scales in 15 rows. Ventrals 186; anal divided; subcaudals 86. Pale greyish brown above, each scale darker in the centre; a darker bar between the eye, another across the parietals and temples, and a third across the nape; lower parts uniform white.

Total length 340 millim.; tail 85.

Cherat, Baluchistan.

This species is described from a single specimen in the Indian Museum, Calcutta, submitted to me by Mr. W. L. Sclater.

Homalosoma collaris, Peracca, *Boll. Mus. Torino*, ix. 1894, no. 167, p. 15.

Rostral much broader than deep, just visible from above; nasal undivided; suture between the internasals as long as or shorter than

that between the præfrontals; frontal not once and a half as long as broad, as long as or longer than its distance from the end of the snout, shorter than the parietals; loreal very small, longer than deep; one præ- and two postoculars; temporals 1+1; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields smaller and in contact with each other. Scales in 15 rows. Ventrals 159-183; anal divided; subcaudals 40-53. Brownish yellow above; head and nape black, with three or four yellow transverse lines; the black of the nape descending to the sides of the throat; lower parts uniform white.

Total length 300 millim.; tail 55.

Syria.

Cyclophis persicus, Anders. *Proc. Zool. Soc.* 1872, p. 392, fig.;
Blanf. Zool. E. Persia, p. 408, pl. xxviii. fig. 1 (1876).

Pseudocyclophis persicus, Boettg. *Zool. Jahrb.* iii. 1888, p. 922.

Rostral nearly twice as broad as deep, just visible from above; nasal undivided; suture between the internasals nearly as long as that between the præfrontals; frontal once and a half as long as broad, about once and a half as broad as the supraocular, as long as its distance from the end of the snout, much shorter than the parietals; no loreal, nasal touching or nearly reaching the præocular; one præ- and one postocular; temporals 1+1; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are at least twice as large as the posterior. Scales in 15 rows. Ventrals 194-216; anal divided; subcaudals 63-77. Yellowish or pale olive above, unspotted; upper surface of head and nape black, the black descending in front of the eye to the anterior lower labials; the rest of the labial region, the rostral, and the lower parts uniform yellowish white.

Total length 400 millim.; tail 90. The specimen in the collection measures 230; tail 45.

Persia.

- a. Hgr. (V. 196; C. 63).

10. *Contia walteri*.

Pseudocyclophis walteri, Boettg. *Zool. Anz.* 1888, p. 262, and *Zool. Jahrb.* iii. 1888, p. 922, pl. xxxiv. fig. 1; *Bouleng. Faun. Ind., Rept.* p. 300 (1890), and *Proc. Zool. Soc.* 1891, p. 632.

Rostral once and a half as broad as deep, visible from above; nasal undivided; suture between the internasals longer than that

between the præfrontals; frontal once and a half as long as broad, nearly twice as broad as the supraocular, as long as its distance from the end of the snout, and much shorter than the parietals; loreal, if present, small, longer than deep; one præ- and one postocular; temporals 1+1; seven upper labials, third and fourth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are longer than the posterior. Scales in 15 rows. Ventrals 211-235; anal divided; subcaudals 73-82. Pale olive or reddish above, anteriorly with more or less distinct black transverse lines, posteriorly uniform or with small black spots; head sometimes black above; lower parts white.

Total length 450 millim.; tail 110.

Rhinostoma occipitale, Hallow. *Proc. Ac. Philad.* 1854, p. 95.

Lamprosoma occipitale, Hallow. *Proc. Ac. Philad.* 1856, p. 110; Baird, *U.S. Mex. Bound. Surv. ii. Rept.* p. 21, pl. xxi. fig. 1 (1859); Bocourt, *Miss. Sc. Mex., Rept.* p. 558, pl. xxxiv. fig. 6 (1883).

Chionactis occipitalis, Cope, *Check-List N. Am. Rept.* p. 35 (1875), and *Proc. U. S. Nat. Mus.* xiv. 1892, p. 605.

Contia occipitalis, Garm. *N. Am. Rept.* p. 91 (1883).

Rostral a little broader than deep, the portion visible from above about half as long as its distance from the frontal; nasal undivided; suture between the internasals shorter than that between the prefrontals; frontal not once and a half as long as broad, broader than the supraoculars, longer than its distance from the end of the

snout, shorter than the parietals; loreal very small, longer than deep; one præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields very small and separated from each other. Scales in 15 rows. Ventrals 147-158 (172?); anal divided; subcaudals 34-44. Yellowish above, reddish in the middle, with black transverse bands forming complete annuli round the tail; white inferiorly.

Total length 285 millim.; tail 56.

Arizona and Texas.

17. *Contia pachyura*.

Contia pachyura, Cope, *Journ. Ac. Philad.* viii. 1876, p. 145.

Frontal rather elongate, but shorter than the parietals; loreal large, deeper than long; one præ- and two postoculars; temporals 1+1; eight upper labials, fourth and fifth entering the eye; chin-shields equal, rather elongate. Scales in 17 rows. Ventrals 133; subcaudals 50. Black, the lower lateral rows of scales with a rufous shade; scales of the first row with grey tips; head blackish brown, with a black line from eye above labials; latter yellowish, unspotted; belly yellowish, each shield with a black extremity.

Total length 335 millim.

Sipurio, Costa Rica.

18. *Contia mitis*.

Contia mitis, Baird & Gir. *Cat. N. Am. Rept.* p. 110 (1853); Girard, *U.S. Explor. Exped.*, *Herp.* p. 125, pl. x. figs. 6-12 (1858), and *Rep. U.S. Explor. R. R.* x. pt. iii. pl. xxxvi. fig. 7 (1859); Cope, *Proc. Ac. Philad.* 1861, p. 74; Garm. *N. Am. Rept.* p. 93 (1883); Bocourt, *Miss. Sc. Mex.*, *Rept.* p. 557, pl. xxxiv. fig. 3 (1883).

Ablabes purpureocauda, Günth. *Cat.* p. 245 (1858).

Homalosoma mite, Jan, *Arch. Zool. Anat. Phys.* ii. 1862, p. 35, and *Icon. Gén.* 13, pl. iv. fig. 1 (1865).

Rostral broader than deep, just visible from above; nasal divided or semidivided; suture between the internasals as long as or shorter than that between the præfrontals; frontal not once and a half as long as broad, longer than its distance from the end of the snout, shorter than the parietals; loreal small, longer than deep; one præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields very small and in contact with each other. Scales in 15 rows. Ventrals 147-167; anal divided; subcaudals 29-39. Brown above, sides darker; a yellowish line along each side of the back; a blackish streak on each side of the head, passing through the eye, and a black spot on the rostral; ventrals whitish, with a broad black anterior border.

Total length 310 millim.; tail 40.

California.

and *Rep. U. S. Explor. R. R.* x. pt. iii. pl. xxxiii. fig. 88 (1859),
and *U. S. Mex. Bound. Surv. ii. Rept.* pl. xix. fig. 3 (1859).
Contia semiannulata, Garm. *N. Am. Rept.* p. 90 (1883).

Nasal divided; frontal broader than the supraocular; loreal longer than deep; one præocular; three postoculars, upper largest and slightly touching the frontal; temporals 1+2; seven upper labials, third and fourth entering the eye. Scales in 15 rows. Ventrals 149; anal divided; subcaudals 39. Orange above, with black cross bands, which form annuli round the tail; sides and belly dull green.

Total length 240 millim.; tail 50.

Sonora.

According to Cope (*Proc. U.S. Nat. Mus.* xiv. 1892, p. 601) this species may prove to be the same as *C. isozona*, the bad state and abnormal condition of Baird and Girard's specimens possibly accounting for the differences on which the two have been separated.

Snout short, concave above, and strongly turned up at the end. Rostral forming a broad suture with the frontal, separating the præfrontals; internasals small or absent; frontal as broad as long, as long as its distance from the end of the snout, nearly as long as the parietals; supraocular about one third the width of the frontal; one præ- and two postoculars; temporals 1+1 or 1+2; seven upper labials, second in contact with the præfrontal, third and fourth entering the eye; three lower labials in contact with the anterior chin-shields; posterior chin-shields very small, scale-like. Scales in 17 rows. Ventrals 138–160; anal divided; subcaudals 34–42.

Total length 390 millim.; tail 65.

Mexico.

A. Uniform dark brown above, white below. (*F. olivacea*, Gray.)

a-b. ♂ (V. 152, 150; Mexico. Mr. Hugo Finck [C.]
 C. 42, 41). (Types.)

In one of the specimens the internasals are fused with the præfrontals, whilst in the other the internasal is distinct on one side.

B. Yellowish or pale brown above, with dark brown transverse spots or cross bars; sides with dark brown spots; head with symmetrical dark markings; lower parts uniform white.

a. Internasals distinct. (*F. publia*, Cope.)

a. Yg. (V. 140; C. 36). Cuernavaca. M. Boucard [C.]

2. *Ficimia cana*.

Gyalopion canum, Cope, *Proc. Ac. Philad.* 1860, p. 243; *Yarrow, Wheeler's Rep. U.S. Explor. Surv. W. 100th Mer.* v. p. 624, pl. xviii. fig. 2 (1875).

Ficimia cana, Garm. *N. Am. Rept.* p. 83 (1883); *Günth. Biol. C.-Am., Rept.* p. 99 (1893).

Closely allied to the preceding, but rostral pointed behind and wedged in between the præfrontals; internasals present, small; seven upper labials, as in the preceding. Ventrals 130-131; subcaudals 28. Pale yellowish or reddish brown above, with brown, dark-edged cross bars, which are broken up into spots on the sides; a large triangular dark spot on the nape, with the point between the parietals; a dark band across the head, to the lower labials, passing through the eyes across the interocular region; lower parts uniform white.

Total length 205 millim.; tail 28.

Arizona and Western Texas.

- a. ♀ (V. 131; C. 28). El Paso, Texas. Hr. A. Forrer [C.].

3. *Ficimia quadrangularis*.

Ficimia quadrangularis, *Günth. Biol. C.-Am., Rept.* p. 99, pl. xxxv. fig. A (1893).

Scaling as in *F. cana*, but seventh upper labial very small, scale-like. Ventrals 129; subcaudals 23. Ground-colour nearly white, each scale with a narrow brown margin; a series of large subquadrangular blackish-brown spots along the back; no spots on the sides; a large blackish band on the nape, confluent with a large blackish blotch covering the frontal and supraocular shields and the greater part of the parietals; lower parts white.

Total length 320 millim.; tail 37.

Western Mexico.

- a. ♀ (V. 129; C. 23). Presidio, near Mazatlan. Hr. A. Forrer [C.].
 (Type.)

101. *CHILOMENISCUS*.

Chilomeniscus, Cope, *Proc. Ac. Philad.* 1860, p. 339, and 1861, p. 302, and *Proc. U.S. Nat. Mus.* xiv. 1892, p. 593.

Maxillary teeth equal or the posterior a little stouter. Head not distinct from neck; snout rounded, very prominent, and much depressed; eye small, with round pupil; rostral large; no loreal;

nasal single, confluent with the internasal. Body cylindrical, short; scales smooth, with apical pits, in 13 rows; ventrals rounded. Tail short; subcaudals in two rows.

Lower California, Sonora, Arizona.

1. *Chilomeniscus stramineus*.

— *cincta*, Garm. *I. c.* p. 100.

Chilomeniscus stramineus fasciatus, Cope, *Proc. U.S. Nat. Mus.* xiv. 1892, p. 595.

Internasals separated by the rostral or forming a short suture; frontal a little longer than broad, nearly as long as the parietals; supraocular very small; nasal not reaching the single præocular; two postoculars; temporals 1+1; seven upper labials, third and fourth entering the eye; anterior chin-shields in contact with the symphysial, twice as long as the posterior. Scales in 13 rows. Ventrals 108-117; anal divided; subcaudals 21-26. Reddish brown above, dotted with dark brown, or with black cross bars which may form complete annuli.

Total length 235 millim.; tail 33.

Lower California and Sonora.

2. *Chilomeniscus ephippicus*.

Chilomeniscus ephippicus, Cope, *Proc. Ac. Philad.* 1875, p. 85; Coues, *Wheeler's Rep. Explor. Surv. W. 100th Mer.* v. p. 625, pl. xviii. fig. 3 (1875).

Rostral entirely separating the internasals; frontal a little longer than broad, nearly as long as the parietals; nasal in contact with the præocular; two postoculars; temporals 1+1; seven upper labials, third and fourth entering the eye; anterior chin-shields separated from the symphysial, posterior very small. Scales in 13 rows. Ventrals 113; anal divided; subcaudals 28. Reddish or yellow above, with black cross bars which do not quite reach the ventrals; tail with nearly complete black rings; snout red, rest of head black; belly white.

Total length 140 millim.; tail 20.

Nevada and Arizona.

102. HOMALOSOMA.

Duberria, part., Fitzing. *N. Class. Rept.* p. 29 (1826).

Homalosoma, Wagl. *Syst. Amph.* p. 190 (1830); Dum. & Bibr. *Erp.*

Cyclophis catenatus, Theob. *Cat. Rept. As. Soc. Mus.* 1868, p. 49.

Rostral broader than deep, visible from above; suture between the internasals a little shorter than or nearly as long as that between the præfrontals; frontal once and a half to twice as long as broad, longer than its distance from the end of the snout, as long as the parietals, once and a half to once and two thirds as broad as the supraocular; nostril in the anterior half of the nasal, which is never in contact with the præocular; a small square loreal usually present; one præ- and two (rarely one) postoculars; temporals 1 + 2; six upper labials, third and fourth entering the eye; two pairs of chin-shields in contact with each other, the anterior in contact with three or four labials. Scales in 15 rows. Ventrals 115-144; anal entire; subcaudals 21-46. Coloration very variable; belly and lower surface of tail uniform yellowish in the middle and greyish on the sides, usually with a regular lateral series of black dots.

Total length 390 millim.; tail 65.

South Africa.

- A. Pale brown or yellowish above, with a vertebral series of black dots; greyish olive or plumbeous on the sides, which are limited above by a series of black dots; lateral ventral dots large.

a-e. ♂ (V. 122, 127; C. 35, 40), hgr. (V. 127, 127; C. 34, 33), & yg. (V. 119; C. 31).

- B. Reddish brown above, blackish olive on the sides, greyish towards the belly; a fine black vertebral line, lateral ventral dots large.

i. ♀ (V. 126; C. 27).

S. Africa.

- C. Like the preceding, but the vertebral line and the ventral dots indistinct.

k. ♀ (V. 118; C. 37).

Port Natal.

Mr. T. Ayres [C.].

- D. Uniform olive-brown above, passing to greyish on the sides; the lateral ventral dots very small.

l. ♂ (V. 115; C. 45).

S. Africa.

- E. Reddish brown or brick-red above, grey on the sides; lateral ventral dots well marked.

m. ♂ (V. 118; C. 42).

S. Africa.

n. ♀ (V. 128; C. 37).

Port Elizabeth.

Mr. J. L. Drege [P.].

F. Uniform reddish brown above and on the sides; lateral ventral dots well marked.

o. ♂ (V. 125; C. 46).

Port Elizabeth. J. M. Leslie, Esq. [P.].

2. *Homalosoma shiranum*. (PLATE XIII. fig. 1.)

Homalosoma lutrix (*non* L.), *Günth. Proc. Zool. Soc.* 1892, p. 555.

Rostral broader than deep, visible from above; suture between the internasals thrice as long as that between the præfrontals; frontal once and two thirds as long as broad, longer than its distance from the end of the snout, shorter than the parietals, nearly twice as broad as the supraocular; nostril in the anterior half of the nasal; no loreal, nasal forming a suture with the præocular; one præ- and one postocular; temporals 1+2; six upper labials, third and fourth entering the eye; two pairs of short chin-shields in contact with each other, the anterior in contact with three labials. Scales in 15 rows. Ventrals 142; anal entire; subcaudals 33. Uniform olive-brown above; belly yellowish white in the middle; outer ends of ventrals and lower rows of scales grey.

Total length 310 millim.; tail 47.

Nyassaland.

a. ♀ (V. 142; C. 33).

Shiré Highlands.

H. H. Johnston, Esq. [P.].

3. *Homalosoma abyssinicum*. (PLATE XIII. fig. 2.)

Homalosoma lutrix (*non* L.), *Blanf. Zool. Abyss.* p. 458 (1870).

Rostral broader than deep, visible from above; suture between the internasals hardly half as long as that between the præfrontals; frontal scarcely longer than broad, as long as its distance from the end of the snout, shorter than the parietals, a little broader than the supraocular; nostril in the anterior half of the nasal; no loreal, nasal forming a suture with the præocular; one præ- and one postocular; temporals 1+2; six upper labials, third and fourth entering the eye; two pairs of chin-shields in contact with each other, the anterior in contact with three labials. Scales in 15 rows. Ventrals 120; anal entire; subcaudals 32. Olive-brown above, with a fine, interrupted, black vertebral line; sides black, dotted with whitish; belly greyish olive, spotted and freckled with black on the sides.

Total length 235 millim.; tail 43.

Abyssinia.

a. ♂ (V. 120; C. 32).

Ashangi.

W. T. Blanford, Esq. [P.].

4. *Homalosoma variegatum*.

Homalosoma variegatum, *Peters, Mon. Berl. Ac.* 1854, p. 622, and *Reise n. Mossamb.* iii. p. 107, pl. xvi. fig. 1 (1882); *Bouleng. Ann. & Mag. N. H.* (6) ii. 1888, p. 140.

Eye rather larger than in *H. lutrix*. Rostral broader than long, visible from above; suture between the internasals a little longer than that between the præfrontals; frontal once and a half as long as broad, longer than its distance from the end of the snout, as long as the parietals, nearly twice as broad as the supraocular; nostril just anterior to the middle of the nasal; a small loreal, nearly as deep as long; one præ- and two postoculars; temporals 1+2; six or seven upper labials, third and fourth or fourth and fifth entering the eye; two pairs of chin-shields in contact with each other, the anterior in contact with three labials. Scales in 15 rows. Ventrals 97-110; anal entire; subcaudals 25-36. Belly reticulated black and whitish.

Total length 250 millim.; tail 33.

South-east Africa (Inhambane and Delagoa Bay).

A. Dark brown above, with irregular lichen-like brownish-white variegation.

a. ♀ (V. 110; C. 25). Delagoa Bay. S.-African Museum [P.].

B. Olive-brown above, with three series of dark brown spots.

b. ♂ (V. 97; C. 36). Delagoa Bay. S.-African Museum [P.].

Cyclophiops, *Bouleng. Ann. Mus. Genova*, (2) vi. 1888, p. 599.

Ablabes, *Bouleng. Fuun. Ind., Rept.* p. 304 (1890).

Maxillary teeth small, equal, 15 to 30; mandibular teeth subequal. Head not or scarcely distinct from neck; eye rather small or moderate, with round pupil; loreal present or absent; nasal entire or divided. Body cylindrical, usually slender; scales smooth or feebly keeled, without apical pits, in 13 to 17 rows; ventrals not angulate laterally. Tail moderate or long; subcaudals in two rows.

South-eastern Asia and Japan.

Synopsis of the Species.

I. Scales in 15 rows.

A. Scales feebly keeled 1. *semicarinatus*, p. 278.

B. Scales smooth.

1. Seven or eight upper labials.

α. Loreal present; nasal divided or semidivided.

Rostral as deep as broad or a little

broader than deep; anal divided 2. *major*, p. 279.Rostral as deep as broad; anal entire .. 3. *doriæ*, p. 279.Rostral much broader than deep 4. *frenatus*, p. 280.β. Loreal present; nasal single . 5. *stoliczkæ*, p. 281.

γ. No loreal; nasal single.

Snout twice as long as the eye 6. *tricolor*, p. 281.Snout not twice as long as the eye 7. *calamaria*, p. 282.

2. Six upper labials; nasal divided; loreal present.

8. *rappii*, p. 282.

II. Scales in 13 rows.

A. Tail not more than one third of the total length.

Seven upper labials, third and fourth

entering the eye 9. *baliodirus*, p. 283.

Eight upper labials, fourth and fifth

entering the eye 10. *scriptus*, p. 284.

B. Tail more than one third of the total length; subcaudals 77-

103..... 11. *longicauda*, p. 284.III. Scales in 17 rows 12. *nicobariensis*, p. 285.1. *Ablabes semicarinatus*.*Eurypholis semicarinatus*, *Hallow. Proc. Ac. Philad.* 1860, p. 493.*Cyclophis nebulosus*, *Günth. Ann. & Mag. N. H.* (4) i. 1868,
p. 418, pl. xix. fig. C.*Ablabes semicarinatus*, *Bouleng. Proc. Zool. Soc.* 1887, p. 148.

Rostral a little broader than deep, just visible from above; nasal divided; eye a little more than half the length of the snout; suture between the internasals much shorter than that between the præfrontals; frontal as long as or a little longer than its distance from the end of the snout, shorter than the parietals; loreal about twice as long as deep; one præ- and two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; four lower

labials in contact with the anterior chin-shields, which are a little shorter than the posterior. Scales in 15 rows, with a very feeble keel along their anterior half. Ventrals 174-192; anal divided; subcaudals 70-82. Olive above, the scales lighter in the centre; the lower scale on each side yellowish, margined with olive or black; young with dark spots anteriorly and four dark longitudinal bands on the hinder half of the body, which disappear or become rather indistinct in the adult; upper lip and lower parts uniform yellowish.

Total length 770 millim.; tail 160.

Loo Choo Islands and Japan.

- a-e.* ♂ (V. 190, 190, 190; Loo Choo Ids. H. Pryer, Esq. [P.].
C. 82, 76, ?) & ♀ (V. 192,

3. *Ablabes doriæ*.

Cyclophiops doriæ, Bouleng. Ann. Mus. Genova, (2) vi. 1888. p. 599, pl. vi. fig. 1.

Ablabes doriæ, *Bouleng. Faun. Ind., Rept.* p. 306 (1890); *W. L. Slater, Journ. As. Soc. Beng.* ix. 1891, p. 235.

Snout convex, profile curved from the frontal region to the lip; rostral as deep as broad, visible from above; nostril between two nasals; internasals a little shorter than the præfrontals; frontal longer than its distance from the end of the snout, shorter than the parietals; loreal small, a little longer than deep; a large præocular, usually with a second, very small, below; two or three postoculars; temporals 1+2 or 2+2; eight upper labials, fourth and fifth entering the eye; four lower labials in contact with the anterior chin-shields; posterior chin-shields about half as large as the anterior. Scales in 15 rows. Ventrals 173-187; anal undivided; subcaudals 77-80. Uniform green above, white below, the green colour extending on to the ends of the ventrals.

Total length 910 millim.; tail 210.

Kakhyen Hills and Assam.

- a. Yg. (V. 173; C. 77). Kakhyen Hills. M. L. Fea [C.]
(One of the types.)

4. *Ablabes frenatus*.

Dipsas monticola (*non Cant.*), *Blyth, Journ. As. Soc. Beng.* xxiii. 1854, p. 294.

Cyclophis frenatus, *Günth. Cat.* p. 120 (1858), and *Rept. Brit. Ind.* p. 230, pl. xix. fig. I (1864); *Jerdon, Proc. As. Soc. Beng.* 1870, p. 80; *Anders. Proc. Zool. Soc.* 1871, p. 188; *Theob. Cat. Rept. Brit. Ind.* p. 157 (1876); *Blanf. Zool. E. Persia*, p. 408 (1876).

Ablabes frenatus, *Bouleng. Faun. Ind., Rept.* p. 306 (1890).

Snout short, convex; eye rather large, three fourths the length of the snout; rostral broader than deep, visible from above; nasal divided or semidivided, suture between the internasals shorter than that between the præfrontals; frontal longer than its distance from the end of the snout, about two thirds the length of the parietals; loreal small, as long as deep or a little longer; one præocular; two postoculars, only the upper in contact with the parietal; temporals 1+2, rarely 2+2; upper labials seven, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are a little shorter than the posterior. Scales in 15 rows. Ventrals 151-163; anal divided; subcaudals 87-96. Olive above, the scales on the anterior part of the body black-edged; a broad black stripe from the eye to the nape, gradually narrowing and disappearing on the anterior fourth of the body; four light longitudinal narrow lines more or less distinct on the front half of the body; lower surface uniform yellow.

Total length 690 millim.; tail 230.

Khasi Hills; Assam.

- a. ♂ (V. 161; C. 95). ["Mountains near Afghanistan."] Khasi Hills. Dr. Griffith. E. India Co. [P.]. (Type.)
b. Hgr. (V. 151; C. 87). Khasi Hills. T. C. Jerdon, Esq. [P.].
c. ♂ (V. 163; C. 96). [Mesopotamia.]

5. *Ablabes stoliczkæ*.

Ablabes stoliczkæ, *W. L. Slater, Journ. As. Soc. Beng.* ix. 1891, p. 234, pl. vi. fig. 1; *Bouleng. Ann. Mus. Genova*, (2) xiii. 1893, p. 325.

Snout rather long and much depressed, twice as long as the diameter of the eye; rostral much broader than deep, visible from above; nasal undivided, thrice as long as deep; internasals a little shorter than the præfrontals; frontal not broader than the supraocular, nearly as long as its distance from the end of the snout, shorter than the parietals; a small loreal; one præ- and two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; four lower labials in contact with the anterior chin-shields, which are as long as the posterior. Scales in 15 rows. Ventrals 150-154; anal divided; subcaudals 116-134. Pale olive-brown above; upper lip and lower parts yellowish white; a black streak from the eye along the temple and the side of the neck, separating the brown colour of the upper parts from the white of the lower.

Total length 600 millim.; tail 255.

Mountains of Burma and Assam.

6. *Ablabes tricolor*.

Herpetodryas tricolor, *Schleg. Phys. Serp.* ii. p. 187, pl. vi. figs. 16-18 (1837).

Cyclophis tricolor, *Günth. Cat.* p. 121 (1858), and *Proc. Zool. Soc.* 1872, p. 590; *Stoliczka, Journ. As. Soc. Beng.* xlii. 1873, p. 122.

Liopeltis tricolor, *Cope, Proc. Ac. Philad.* 1860, p. 559; *Jan, Icon. Gén.* 31, pl. vi. fig. 2 (1869).

Snout rather long and depressed, twice as long as the diameter of the eye; rostral broader than deep, visible from above; nasal undivided; suture between the internasals as long as or a little shorter than that between the præfrontals; frontal not broader than the supraocular, as long as its distance from the end of the snout, shorter than the parietals; no loreal, the præfrontal in contact with the second and third labials; one præ- and two postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are a little shorter than the posterior. Scales in 15 rows. Ventrals 140-187; anal divided; subcaudals 103-130. Olive or greenish above; a black streak on each side of the head and anterior part of the body, passing through the eye; upper lip and lower parts yellowish white; a pale olive streak along each side of the belly.

Total length 560 millim.; tail 220.

8. *Ablabes rappii*.

Ablabes rappii, Günth. Proc. Zool. Soc. 1860, p. 154, pl. xxvi. fig. B, and Rept. Brit. Ind. p. 225 (1864); Anders. Proc. Zool. Soc. 1871, p. 171; Bouleng. Faun. Ind., Rept. p. 307 (1890).

— owenii, Günth. Proc. Zool. Soc. 1860, p. 155, pl. xxvi. fig. A.

Rostral twice as broad as deep, just visible from above; nostril between two nasals; suture between the internasals a little shorter than that between the præfrontals; frontal slightly shorter than its distance from the end of the snout, a little shorter than the parietals; loreal as long as deep or a little longer than deep; one præocular; two postoculars, only the upper in contact with the parietal; temporals 1+1; six upper labials, third and fourth

entering the eye; four lower labials in contact with the anterior chin-shields, which equal or a little exceed the posterior in length. Scales in 15 rows. Ventrals 178-195; anal divided; subcaudals 60-75. Brown above, with a broad dark collar and a double series of transverse dark spots on the anterior part of the body; these markings most distinct in the young; lower parts uniform yellowish.

Total length 460 millim.; tail 110.

10. *Ablabes scriptus*.

Ablabes scriptus, *Theob. Journ. Linn. Soc.* x. 1868, p. 42, and *Cat. Rept. As. Soc. Mus.* 1868, p. 49, and *Cat. Rept. Brit. Ind.* p. 154 (1876); *Bouleng. Faun. Ind., Rept.* p. 305 (1890).

Closely allied to *A. baliodirus*. Scales in 13 rows. Præocular one; postoculars two, small; loreal very small, much smaller than postocular; præfrontals broader than long; upper labials eight, the third, fourth, and fifth entering the orbit; a long narrow temporal, forming a suture with both postoculars and the sixth and seventh labials; seventh labial largest, more than twice as broad as the temporal; two pairs of chin-shields, the hinder rather larger than the other, first in contact with four labials; lower labials seven, fifth largest. Colour above brown; a few black dots on either side of spine on the front part of the trunk; a black mark under the eye, followed by a white upright border involving the postoculars; a black-bordered white patch on the last upper labial, and a white collar on the nape. Beneath white.

Martaban, Burma.

11. *Ablabes longicauda*.

Ablabes longicaudus, *Peters, Mon. Berl. Ac.* 1871, p. 574, and *Ann. Mus. Genova*, iii. 1872, p. 35, pl. v. fig. 1.

— *quinquestriatus*, *F. Müller, Verh. nat. Ges. Basel*, vi. 1878, p. 657, pl. ii. fig. B, and vii. 1882, p. 143.

Rostral broader than deep, just visible from above; nasal divided; eye three fourths the length of the snout; suture between the internasals as long as or a little shorter than that between the præfrontals; frontal longer than its distance from the end of the snout, shorter than the parietals; a small loreal, as long as deep or a little deeper than long, sometimes confluent with the posterior nasal; one or two præ- and two postoculars; temporals 1+2;

eight (or seven) upper labials, third, fourth, and fifth (or third and fourth) entering the eye; four lower labials in contact with the anterior chin-shields, which are slightly longer than the posterior. Scales in 13 rows. Ventrals 114-122; anal divided; subcaudals 77-103. Lustrous dark brown or black above, with three yellowish longitudinal lines lost on the hinder half of the body; the vertebral line beginning behind the nape, the laterals widening anteriorly and descending obliquely with their black borders towards the throat; a yellow chevron-shaped collar, pointing backwards; the black of the upper surface of the head descending as a triangular patch on the temple; eye bordered with black; upper labials yellowish, with a few small black spots: lower parts uniform yellowish white.

Total length 430 millim.; tail 170.

Borneo, Sumatra, Pinang.

 wak, 2000 ft.

The following snake is perhaps to be regarded as a variety of *A. longicauda*; the description is, unfortunately, insufficient, and the figure represents the animal with a vertical pupil:—

DIADOPHIS BIPUNCTATUS, v. *Lidth de Jeude*, in *M. Weber, Zool. Ergebn.* p. 184, pl. xvi. fig. 9 (1890).

One præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye. Scales in 13 rows. Ventrals 117; subcaudals 90. Upper parts dark brown, lower parts yellow, without stripes or spots; head and neck black; two small white spots on the parietal shields; three yellow cross bands on each side of the neck, the first pair meeting in the middle and forming a collar, the third not clearly marked; a yellow spot behind and under the orbit; the three anterior upper labials partly yellow, partly black; a triangular black spot at each end of the ventral and caudal shields, close to the outer row of scales, the spots forming a continuous black line along each side of the belly.

Kaju Tanam, Sumatra.

12. *Ablabes nicobariensis*.

Ablabes nicobariensis, *Stoliczka, Journ. As. Soc. Beng.* xxxix. 1870, p. 184, pl. xi. fig. 1; *Bouleng. Faun. Ind., Rept.* p. 307 (1890).

Rostral low, wide, not reaching the top of the head; nostril between two nasals; internasals about half the size of the præ-frontals; frontal somewhat larger than the supraoculars; parietals about one fourth larger than the frontal, in contact with both postoculars; loreal united with the postnasal; one præ- and two postoculars; temporals 1+2: upper labials seven, third and fourth

entering the eye; both pairs of chin-shields subequal in size. Scales in 17 rows. Ventrals 189; anal divided; subcaudals 87. Anterior half of the body reddish brown above, posterior blackish grey; head above blackish, the first three labials with yellow spots; a short broad yellow streak from behind and below the eye posteriorly to the angle of the mouth; a black collar, margined on both sides with an interrupted yellow band, of which the anterior is the most distinct; an indistinct series of blackish-grey dorsal spots, almost forming a dark undulating band; sides marbled and freckled blackish grey, this colour being separated from the upper brown one by a series of closely-set black spots, which are partially conspicuous on the posterior part of the body; chin dusky; lower parts yellow with a vermilion tinge, each ventral with a large black spot near its outer extremity.

Total length 440 millim.; tail 110.

Camorta, Nicobars.

104. GRAYIA.

Heteronotus (non *Lap.*), *Hallow. Proc. Ac. Philad.* 1857, p. 67.

Grayia, *Günth. Cat. Col. Sn.* p. 50 (1858).

Glaniolestes, *Cope, Proc. Ac. Philad.* 1862, p. 191.

Leionotus (non *Bibr.*), *Jan, Elenco sist. Ofid.* p. 68 (1863), and *Arch. Zool. Anat. Phys.* iii. 1865, p. 240.

Macrophis, *Bocage, Journ. Sc. Lisb.* i. 1866, p. 67.

Maxillary teeth equal, 22 to 25; mandibular teeth equal. Head distinct from neck; eye moderate, with round pupil; nostril directed upwards, in a semidivided nasal shield. Body cylindrical, stout; scales short and smooth, without apical pits, in 17 or 19 rows; ventrals rounded. Tail rather long; subcaudals in two rows.

Tropical Africa.

Synopsis of the Species.

I. Fourth upper labial entering the eye; two postoculars; two superposed anterior temporals.

Seven or eight upper labials; ventrals 145-161. 1. *smythii*, p. 286.

Nine upper labials; ventrals 219 2. *furcata*, p. 287.

II. Fourth and fifth upper labials entering the eye; three postoculars; a single anterior temporal 3. *giardi*, p. 288.

Macrophis ornatus, Bocage, *t. c.* p. 67.

Rostral broader than deep, just visible from above; internasals longer than broad, as long as or longer than the præfrontals; frontal once and two thirds to twice as long as broad, longer than its distance from the end of the snout, as long as or a little shorter than the parietals; loreal longer than deep; one præ- and two postoculars; temporals 2+3; seven or eight upper labials, fourth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are a little shorter than the posterior. Scales in 17 (rarely 19) rows. Ventrals 145-161; anal divided; subcaudals 74-103. Brown or olive above, with black cross bands tapering to a point towards the ventrals, or with light black-edged cross bands widening towards the belly; or dark olive with the scales edged with black; or uniform blackish olive; belly yellow, uniform or spotted with black, or entirely blackish.

Total length 1250 millim.; tail 450.

West Africa, from Sierra Leone to Angola.

A. Belly yellow, with or without black spots.

2. *Grayia furcata*.

Grayia furcata, Mocquard, *Bull. Soc. Philom.* (7) xi. 1887, p. 71.

Distinguished from *G. smythii* by the smaller and more irregular temporals, nine upper labials instead of seven or eight, and the more numerous ventral shields (219). Subcaudals 88. In colour resembling the barred form or *G. smythii*; posterior ventral and subcaudal regions blackish.

Total length 1012 millim.; tail 292.

Brazzaville, Congo.

3. *Grayia giardi*.

Grayia giardi, *Dollo, Bull. Mus. Belg.* iv. 1886, p. 158, fig.

One præ- and three postoculars; temporals 1+2; eight upper labials, fourth and fifth entering the eye. Scales in 19 rows.

Lake Tanganyika.

105. **XENUROPHIS.**

Xenurophis, *Günth. Ann. & Mag. N. H.* (3) xii. 1863, p. 357.

Maxillary teeth 35, closely set, equal; mandibular teeth equal. Head distinct from neck; eye large, with round pupil. Body cylindrical; scales smooth, without pits, in 15 rows; ventrals rounded. Tail long, with two dorsal series of very large, shield-like scales; subcaudals in two rows.

West Africa.

1. *Xenurophis cæsar*.

Xenurophis cæsar, *Günth. l. c.* pl. vi. fig. C; *Bouleng. Zool. Rec.* 1891, *Rept.* p. 11.

Grayia longicaudata, *Mocquard, Bull. Soc. Philom.* (8) iii. 1891, *C. R.* p. 9.

Eye as long as the snout. Rostral twice as broad as deep, just visible from above; internasals as long as or a little longer than broad, a little shorter than the præfrontals; frontal not broader than the supraocular, once and two thirds to twice as long as broad, slightly longer than its distance from the end of the snout, as long as the parietals; loreal as long as deep, or deeper than long; one præ- and two postoculars; temporals 2+3; eight upper labials, fourth and fifth entering the eye; five lower labials in contact with the anterior chin-shields, which are as long as or a little shorter than the posterior. Scales in 15 rows (in 4 rows on the tail). Ventrals 125-149; anal divided; subcaudals 143-161. Dark olive above, with regular narrow, whitish, black-edged cross bands; a few light spots on the head and two whitish black-edged oblique bands on each side, the anterior behind the eye, the second on the temple; lower parts uniform yellowish white.

Total length 600 millim. (tail injured) When intact the tail is nearly as long as the body.

West Africa.

a. ♀ (V. 145; C. ♀).

— *harperti*, part., *Bocourt, Miss. Sc. Mex., Rept.* p. 543, pl. xxxii. fig. 3 (1883).

Rostral nearly as deep as broad, visible from above; internasals much shorter than the præfrontals; frontal longer than broad, shorter than the parietals; loreal once and a half to twice and a half as long as deep; two or three postoculars; temporals 1+2; six upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are as long as or shorter than the posterior. Scales in 15 rows, smooth or feebly keeled. Ventrals 111–128; anal divided; subcaudals 24–37. Yellowish or greyish brown above, uniform or with minute black dots which may form two or four longitudinal series; dull yellow beneath. Total length 220 millim.; tail 40.

United States, from Maryland and Illinois to Georgia and Texas.

a-c. ♂ (V. 112, 113; C. 34, Raleigh, N. Carolina. Messrs. Brimley [C.]. 36) & ♀ (V. 115; C. 24).

2. *Virginia elegans*.

Virginia elegans, *Kennicott, Proc. Ac. Philad.* 1859, p. 99; *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 24, and *Icon. Gén.* 12, pl. ii. fig. 6 (1865); *Cope, Proc. U.S. Nat. Mus.* xiv. 1892, p. 599.

— *harperti*, part., *Bocourt, Miss. Sc. Mex., Rept.* p. 543, pl. xxxii. fig. 4 (1883).

Differs from the preceding in the narrower scales (which may be feebly keeled) in 17 rows. Ventrals 135; subcaudals 31. Uniform light olivaceous brown above, dull yellowish white beneath.

Southern Illinois, Arkansas, Texas.

Tropidoclonium, part., *Bocourt, Miss. Sc. Mex., Rept.* p. 738 (1893).

Maxillary short, with 12 to 16 teeth, which decrease in size in front and behind; posterior mandibular teeth gradually decreasing in size. Head distinct from neck; eye moderate or large, with vertically elliptic pupil; præoculars may be absent. Body elongate, cylindrical or a little compressed; scales smooth or feebly keeled, without pits, in 13 to 17 rows; ventrals rounded. Tail moderate; subcaudals in two rows.

Central America.

Synopsis of the Species.

- I. Eye rather large; loreal shield not entering the eye; two præoculars; frontal a little longer than broad.

- Scales in 17 rows 1. *fasciata*, p. 295.
Scales in 15 rows 2. *philippii*, p. 295.

- II. Eye moderate.

- A. Scales feebly keeled, in 17 rows; one or two præoculars.

- Loreal at least once and two thirds as long as deep, entering the eye; frontal not broader than long; six upper labials 3. *fischeri*, p. 296.
Loreal short, entering the eye or separated from it by the præoculars; frontal a little broader than long 4. *sartorii*, p. 296.

- B. Scales smooth, in 15 or 13 rows; no præocular.

- Scales in 15 rows; frontal as long as broad. 5. *annulifera*, p. 297.
Scales in 13 rows; frontal longer than broad. 6. *anthracops*, p. 297.

1. *Tropidodipsas fasciata*.

Tropidodipsas fasciata, part., *Günth. Cat.* p. 181 (1858).

Leptognathus fasciata, *Cope, Proc. Ac. Philad.* 1868, pp. 109 & 137.

— (*Tropidodipsas*) subannulatus, *F. Müll. Verh. nat. Ges. Basel*, viii. 1887, p. 274, pl. i. fig. 5.

Eye rather large. Rostral a little broader than deep, just visible from above; internasals two fifths the length of the præfrontals; frontal a little longer than broad, as long as its distance from the end of the snout, shorter than the parietals; loreal as long as deep, not entering the eye; two præoculars; two postoculars; temporals 1+2 or 2+2; seven or eight upper labials, fourth and fifth entering the eye, sixth or seventh largest; four or five lower labials in contact with the anterior chin-shields, which are a little longer than the posterior. Scales in 17 rows, dorsals feebly keeled. Ventrals 171–176; anal entire; subcaudals 71–78. Dark brown or black, with 20 to 38 white (red?) or pale brown annuli, some of which are complete, others broken up above and below and forming alternating cross bars; throat and a bar across occiput white or pale brown.

Total length 600 millim.; tail 140.

Mexico.

2. *Tropidodipsas philippii*.

Tropidodipsas fasciata, part., *Günth. Cat.* p. 181 (1858).

Leptognathus philippii, *Jan, Elenco*, p. 101 (1863), and *Icon. Gén.* 37, pl. v. fig. 1 (1870).

— albocinctus, *Fischer, Jahrb. Hamb. Wiss. Anst.* ii. 1885, p. 107, pl. iv. fig. 9.

Eye rather large. Rostral a little broader than deep, just visible from above; internasals two fifths the length of the præfrontals; frontal a little longer than broad, as long as its distance from the end of the snout, shorter than the parietals; loreal as long as or slightly longer than deep, not entering the eye; two præoculars; two postoculars; temporals 1+2; seven upper labials, fourth and fifth entering the eye, sixth largest; six lower labials in contact with the anterior chin-shields, which are more than twice as long as the posterior. Scales in 15 rows, dorsals faintly keeled. Ventrals 178–180; anal entire; subcaudals 67–71. A series of large roundish blackish-brown spots, separated by narrow whitish interspaces, occupies the upper parts, the spots descending to the sides of the belly; upper lip white; belly white, with a few dark brown spots; the dark brown predominates under the tail.

Total length 330 millim.; tail 80.

Western Mexico, California (?).

Eye moderate. Rostral a little broader than deep, just visible from above; internasals half the length of the præfrontals; frontal a little broader than long, a little shorter than its distance from the end of the snout, much shorter than the parietals; loreal short and separated from the eye by the præoculars, or fused with the lower præocular; two postoculars; temporals 1+2; seven or eight upper labials (exceptionally six), fourth and fifth or fifth and sixth entering the eye, sixth largest; five lower labials in contact with the anterior chin-shields, which are twice as long as the posterior. Scales in 17 rows, dorsals feebly keeled. Ventrals 170-190; anal entire; sub-

caudals 51-74. Black, with 16 to 30 white (red), usually black-dotted annuli, which may be interrupted on the belly; snout and chin black; throat, and a bar across occiput or nape, white (red).

Total length 620 millim.; tail 140.

Mexico and Guatemala.

A. Most of the annuli interrupted on the belly.

- a. ♀ (V. 170; C. 51). Mexico. (One of the types of *T. fasciata*.)

Loreal shield entering the eye, between two præoculars, on one side, separated from the eye by the præoculars on the other side.

- b. ♀ (V. 190; C. 56). Yucatan.

Loreal bordering the eye on both sides.

- c. ♀ (V. 182; C. 56). —?

Zoological Society.

Loreal shield entering the eye, between two præoculars, on one side, separated from the eye by the præoculars on the other side.

B. Annuli all complete.

- d. ♂ (V. 181; C. 68). Hacienda Cubilguitz, north F. C. Sarg, Esq.
of Coban, Vera Paz. [P.]

Loreal bordering the eye on both sides.

- e. ♂ (V. 179; C. 66). Orizaba.

Loreal bordering the eye, longitudinally cleft.

5. *Tropidodipsas annulifera*. (PLATE XIV. fig. 1.)

Eye moderate. Rostral a little broader than deep, just visible from above; internasals half the length of the præfrontals; frontal as broad as long, slightly shorter than its distance from the end of the snout, much shorter than the parietals; loreal once and a half as long as deep, entering the eye; præfrontal entering the eye; no præocular; two postoculars; temporals 1+2 or 3; six or seven upper labials, third or fourth or fourth and fifth entering the eye; four or five lower labials in contact with the anterior chin-shields, which are once and a half as long as the posterior. Scales smooth, in 15 rows. Ventrals 156; anal entire; subcaudals 52. Black, with 20 white (red?) complete annuli, which are broader on the belly than on the back; throat, and a band across the occiput, white.

Total length 430 millim.; tail 90.

Habitat unknown.

- a. ♂ (V. 156; C. 52).

—?

Zoological Society.

6. *Tropidodipsas anthracops*.

Leptognathus anthracops, Cope, *Proc. Ac. Philad.* 1868, pp. 108 & 136.

Physiognomy of *T. sartorii*. Frontal longer than broad; loreal longer than deep, entering the eye; no præocular; two postoculars; temporals 1+2; seven upper labials, fourth and fifth entering the eye, sixth largest. Scales smooth, in 13 rows. Ventrals 177; anal entire; subcaudals 76. Black, with yellow rings continuous on the belly, but not on the anterior parts above; yellow scales black-edged; temples and nape yellow.

Total length 480 millim.; tail 130.

Nicaragua.

111. DIROSEMA.

Maxillary short, with 10 to 16 teeth, the anterior and posterior of which are the shortest; mandibular teeth small, decreasing in length posteriorly. Head distinct from neck; eye small, with vertically elliptic pupil; præocular absent, loreal and præfrontal entering the eye. Body moderately elongate, cylindrical; scales without pits, smooth or feebly keeled, in 15 or 17 rows; ventrals rounded. Tail short; subcaudals in two rows.

Central America.

Connects *Tropidodipsas* with *Geophis*.

Synopsis of the Species.

I. Scales in 17 rows.

Nostril between two nasals; fifth upper labial largest; scales smooth

1. *bicolor*, p. 298.

Nostril between two nasals; sixth upper labial largest; scales faintly keeled . .

2. *omiltemanum*, p. 299.

Skull of *Atractus crassicaudatus*.

Maxillary short, with 8 to 12 teeth; maxillary and mandibular teeth decreasing in size posteriorly. Head not distinct from neck; eye small, with round or subelliptic pupil; nostril between two nasals; præocular usually absent, loreal and præfrontal entering the eye. Body cylindrical; scales smooth, without pits, in 15 or 17 rows; ventrals rounded. Tail short or rather long; subcaudals in two rows.

Central and South America.

Synopsis of the Species.

I. Symphysial shield separated from the chin-shields.

A. Loreal not more than once and a half as long as deep.

Scales in 15 rows; one postocular 1. *elaps*, p. 302.

Scales in 17 rows; one postocular 2. *latifrons*, p. 303.

Scales in 17 rows; two postoculars 3. *modestus*, p. 304.

B. Loreal at least twice as long as deep.

1. Two pairs of chin-shields; usually a single postocular.

- Scales in 15 rows; præfrontals as long as broad; eight upper labials 4. *vittatus*, p. 304.
 Scales in 17 rows; præfrontals as long as broad; six upper labials 5. *latifrontalis*, p. 304.
 Scales in 17 rows; præfrontals much longer than broad; six upper labials. 6. *longiceps*, p. 305.

2. A single pair of moderately broad chin-shields; anal entire.

a. Scales in 17 rows.

a. Two postoculars.

* Præfrontals a little broader than long.

- Ventrals 140; rostral broader than deep; six upper labials 7. *peruvianus*, p. 305.
 Ventrals 143-158; rostral broader than deep; seven upper labials 8. *guentheri*, p. 305.
 Ventrals 175-191; rostral nearly as deep as broad; seven upper labials .. 9. *bocourti*, p. 306.

** Præfrontals as long as broad; ventrals 146-161.

- Rostral once and a half as broad as deep; frontal slightly broader than long .. 10. *maculatus*, p. 306.
 Rostral nearly as deep as broad; frontal as long as broad or a little longer.... 15. *crassicaudatus*, p. 310.

*** Præfrontals a little longer than broad.

- Frontal as long as broad or slightly longer than broad; loreal twice and a half to thrice and a half as long as broad; ventrals 163-182 11. *major*, p. 307.
 Frontal a little longer than broad; loreal twice as long as broad; ventrals 160. 12. *isthmicus*, p. 307.
 Frontal as long as broad or a little broader than long; loreal twice and a half to thrice and a half as long as deep; ventrals 143-160 13. *badius*, p. 308.

β. A single postocular; frontal longer than broad; eight upper labials 14. *torquatus*, p. 309.

b. Scales in 15 rows.

a. Snout obtuse; ventrals 150-172; subcaudals 16-32.

* Eight upper labials.

- Præfrontals longer than broad; both postoculars in contact with temporal. 16. *duboisii*, p. 310.
 Præfrontals as long as broad; lower postocular not in contact with temporal.. 17. *occipitoalbus*, p. 310.

** Seven upper labials.

Frontal a little broader than long 18. *reticulatus*, p. 311.

Frontal once and a half as broad as

long 19. *emmeli*, p. 311.

β. Snout more or less pointed; ventrals 125-150; sub-caudals 11-19 20. *trilineatus*, p. 312.

3. A single pair of very large chin-shields; anal divided.

21. *quadrivirgatus*, p. 312.

II. Symphysial shield in contact with the chin-shields; tail long and thick 22. *favæ*, p. 313.

1. *Atractus elaps*.

Rhabdosoma elaps, Günth. Cat. p. 241 (1858), and Zool. Rec. 1865, p. 151.

Rhabdosoma brevifrenum, Jan, Arch. Zool. Anat. Phys. ii. 1862, p. 12, and Icon. Gén. 10, pl. iv. fig. 1 (1865).

Geophis elaps, Günth. Ann. & Mag. N. H. (4) i. 1868, p. 415.

Snout rounded. Rostral rather large, broader than deep, the portion visible from above at least half as long as its distance from the frontal; internasals nearly twice as broad as long; frontal as long as broad or a little broader than long, as long as its distance

from the end of the snout, shorter than the parietals; loreal short, not or but slightly longer than deep; one postocular; temporals 1+2; six upper labials, third and fourth entering the eye; three or four lower labials in contact with the single pair of moderately large chin-shields, which are separated from the symphysial. Scales in 15 rows. Ventrals 144-167; anal entire; subcaudals 23-37. Black above, with light annuli which widen towards the belly; or reddish with black annuli disposed in pairs; belly barred black and yellow.

Total length 610 millim.; tail 60.

Ecuador and Brazil.

a. ♂ (V. 144; C. 29).	W. Ecuador.	Mr. Fraser [C.] (Type.)
b. ♀ (V. 167; C. 26).	Canelos, Ecuador.	Mr. Buckley [C.].
c. ♂ (V. 163; C. 37).	Pebas.	Mr. Hauxwell [C.].
d. ♀ (V. 155; C. 28).	Upper Amazon.	Mr. E. Bartlett [C.].

2. *Atractus latifrons*.

Geophis latifrons, Günth. *Ann. & Mag. N. H.* (4) i. 1868, p. 415, pl. xix. fig. B, and ix. 1872, p. 15.

Snout rounded. Rostral rather large, a little broader than deep, the portion visible from above at least half as long as its distance from the frontal; internasals once and a half to twice as broad as long; frontal as long as broad or a little broader than long, as long as its distance from the end of the snout, shorter than the parietals; loreal short, not or but slightly longer than deep; one postocular; temporals 1+2; six upper labials, third and fourth entering the eye; three or four lower labials in contact with the single pair of moderately large chin-shields, which are separated from the symphysial. Scales in 17 rows. Ventrals 142-150; anal entire; subcaudals 35-40. Body with black and yellow or red rings, which may be broken up and irregular on the belly, the scales on the red rings black-edged; head black above, with a yellow vertical bar in front of the eye, and a triangular yellow blotch on the temple, extending or not across the occiput.

Total length 410 millim.; tail 70.

Upper Amazon.

A. Black rings disposed in 12 to 17 pairs, each enclosing a narrow yellow interspace and separated by broad red rings; a yellow bar across the occiput.

a. Hgr. (V. 150; C. 36).	Pebas.	Mr. Hauxwell [C.] (Type.)
b. Hgr. (V. 142; C. 35).	Moyobamba.	Mr. A. H. Roff [C.].
c. ♂ (V. 143; C. ?).	Upper Amazon.	Mr. E. Bartlett [C.].

B. Black rings 65, separated by narrow yellow rings; no yellow across the occiput.

d. ♂ (V. 146; C. 40).	Upper Amazon.	H. W. Bates, Esq. [C.].

3. *Atractus modestus*. (PLATE XV. fig. 1.)

Rhabdosoma crassicaudatum (non Dum. & Bibr.), Günth. Proc. Zool. Soc. 1859, p. 411.

Snout rounded. Rostral rather large, broader than deep, the portion visible from above one third as long as its distance from the frontal; internasals moderately large, a little broader than long; frontal as long as broad, as long as its distance from the rostral, shorter than the parietals; loreal once and a half as long as deep; two postoculars; temporals 1+2; six upper labials, third and fourth entering the eye; four lower labials in contact with the single pair of moderately large chin-shields, which are separated from the symphysial. Scales in 17 rows. Ventrals 173; anal entire; subcaudals 38. Uniform plumbeous above, on the sides of the ventrals, and on the subcaudals; ventrals yellowish in the middle.

Total length 380 millim.; tail 50.

Ecuador.

a. ♂ (V. 173; C. 38). W. Ecuador. Mr. Fraser [C.].

4. *Atractus vittatus*. (PLATE XV. fig. 2.)

Rhabdosoma crassicaudatum, part., Günth. Cat. p. 11 (1858).

Snout obtusely pointed. Rostral small, as deep as broad, visible from above; internasals very small; præfrontals as long as broad; frontal as long as broad, as long as its distance from the rostral, much shorter than the parietals; loreal thrice as long as deep; one (or two) postoculars; temporals 1+1; eight upper labials, fourth, fifth, and sixth entering the eye; two pairs of chin-shields, the anterior rather elongate, in contact with four lower labials, and separated from the symphysial, the posterior two thirds the length of the anterior and in contact along their inner borders. Scales in 15 rows. Ventrals 148; anal entire; subcaudals 18. Dark brown above, with four black longitudinal lines, the space between the inner and outer pair lighter, reddish brown; belly yellow, much spotted with black; two black stripes along the lower surface of the tail.

Total length 405 millim.; tail 35.

Venezuela.

a. ♀ (V. 148; C. 18). Caracas.

5. *Atractus latifrontalis*.

Geophis latifrontalis, Garman, N. Am. Rept. p. 103 (1883), and Bull. Essex Inst. xix. 1888, p. 127.

Rhabdosoma mutitorques, Cope, Proc. Amer. Philos. Soc. xxii. 1885, p. 384.

Geophis mutitorques, Günth. Biol. C.-Am., Rept. p. 93 (1893).

Snout broad, rounded. Rostral broader than deep; internasals small; præfrontals as long as broad; frontal broader than long;

one postocular (exceptionally two); temporals 1+2; six upper labials, third and fourth entering the eye; two pairs of chin-shields, posterior half as long as anterior. Scales in 17 rows. Ventrals 172-179; anal entire; subcaudals 24-32. Uniform dark plumbeous above, margins of scales lighter; a yellow occipital bar may be present, crossing the parietal shields; ventrals white, mottled with leaden, or uniform leaden.

Total length 455 millim.; tail 45.

Mexico (San Luis Potosi and Hidalgo).

6. *Atractus longiceps*.

Rhabdosoma longiceps, Cope, *Proc. U.S. Nat. Mus.* ix. 1886, p. 189.

Agrees in most respects with *A. latifrontalis*, but snout more elongate and præfrontals much longer than broad. Ventrals 173; subcaudals 28. Extremity of tail with a compressed horny cap. Colour everywhere blackish; some brownish shades on the sides near the head; free edges of ventral and subcaudal shields, and of lateral scales, lighter.

Total length 445 millim.; tail 44.

Vera Cruz, Mexico.

7. *Atractus peruvianus*.

Rhabdosoma peruvianum, Jan, *Arch. Zool. Anat. Phys.* ii. 1862, p. 12, and *Icon. Gén.* 10, pl. iv. fig. 2 (1865).

Snout obtuse. Rostral much broader than deep, just visible from above; internasals small; præfrontals not quite as long as broad; frontal small, as long as broad, as long as the præfrontals, much shorter than the parietals; loreal at least twice as long as deep; two postoculars: temporals 1+2; six upper labials, third and fourth entering the eye; four lower labials in contact with the single pair of chin-shields, which are moderately large and separated from the symphysial. Scales in 17 rows. Ventrals 140; anal entire; subcaudals 31. Brown above, with five longitudinal series of black spots; ventrals black, with a white spot at the outer end; lower surface of tail white, spotted with black.

Total length 280 millim.; tail 40.

Peru.

8. *Atractus guentheri*.

Rhabdosoma maculatum, part., Günth. *Cat.* p. 241 (1858).

Geophis guentheri, Wucherer, *Proc. Zool. Soc.* 1861, p. 115, pl. xix. fig. 1; Günth. *Zool. Rec.* 1865, p. 151.

Rhabdosoma univittatum, Jan, *Arch. Zool. Anat. Phys.* ii. 1862, p. 15, and *Icon. Gén.* 11, pl. ii. fig. 2 (1865).

Snout rounded. Rostral small, broader than deep, just visible from above; internasals very small; præfrontals broader than long; frontal a little broader than long (or as long as broad), as long as

its distance from the end of the snout, much shorter than the parietals; loreal twice as long as deep; two postoculars; temporals 1+2 (or 2+2); seven upper labials, third and fourth entering the eye; four (or three) lower labials in contact with the single pair of chin-shields, which are moderately large and separated from the symphysial. Scales in 17 rows. Ventrals 143-158; anal entire; subcaudals 19-33. Pale yellowish brown or orange above, with or without dark edges to the scales; uniform whitish beneath.

Total length 330 millim.; tail 45.

Brazil; Venezuela.

A. A broad black vertebral stripe and a black line along each side, replaced by a series of spots on the anterior part of the body.

a. ♂ (V. 143; C. 30). Caunavieras, south Dr. Wucherer [C.].
of Bahia. (Type.)

B. Two or four longitudinal series of black, light-edged, alternating spots or narrow cross bars.

b, c. ♀ (V. 152; C. 19) Rio Janeiro. A. Fry, Esq. [P.].
& hgr. (V. 158; C. 21).

d, e. Yg. (V. 145, 143; C. Brazil? G. Lennox Conyngham,
26, 27). Esq. [P.].

9. *Atractus bocourti*.

Rhabdosoma maculatum, part., *Bocourt, Miss. Sc. Mex., Rept.* p. 540,
pl. xxxv. fig. 1 (1883).

Snout obtuse. Rostral small, nearly as deep as broad, just visible from above; internasals very small; præfrontals slightly broader than long; frontal a little broader than long, as long as its distance from the rostral, much shorter than the parietals; loreal twice and a half as long as deep; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the single pair of chin-shields, which are moderately large and separated from the symphysial. Scales in 17 rows. Ventrals 175-191; anal entire; subcaudals 25-39. Pale brown above, with five longitudinal series of small black spots; a black streak on each side of the head, passing through the eye, another along the nape, and a fifth along the tail; yellowish beneath, with some irregular black blotches and on each side a series of partly confluent small spots or short streaks, forming two lines along the belly.

Total length 390 millim.; tail 40.

Northern Peru, Ecuador.

a. ♀ (V. 175; C. 25). Acomayo, N. Peru. Messrs. Veitch [P.].

10. *Atractus maculatus*. (PLATE XIV. fig. 3.)

Isoscelis maculata, *Günth. Cat.* p. 204 (1858).

Rhabdosoma maculatum, part., *Günth. l. c.* p. 241.

Rhabdosoma zebrinum, *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 15.

Snout rounded. Rostral small, once and a half as broad as deep, just visible from above; internasals very small, a little broader than long; præfrontals as long as broad; frontal slightly broader than long, as long as its distance from the end of the snout, much shorter than the parietals; loreal nearly thrice as long as deep; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the single pair of chin-shields, which are moderately large and separated from the symphysial. Scales in 17 rows. Ventrals 148-159; anal entire; subcaudals 21-26. Pale yellowish or reddish brown above, some of the scales edged with black, with numerous regular black transverse spots or bars; upper lip and lower parts uniform whitish.

Total length 335 millim.; tail 40.

Brazil.

11. *Atractus major*.

Rhabdosoma maculatum (non Günth., 1858), *Günth. Proc. Zool. Soc.* 1859, p. 411.

Rabdosoma badium, part., *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 13, and *Icon. Gén.* 11, pl. i. fig. 1 (1865).

Snout obtuse. Rostral small, nearly as deep as broad, just visible from above; internasals very small; præfrontals longer than broad; frontal as long as broad, or slightly longer than broad, as long as its distance from the internasals or from the rostral, much shorter than the parietals; loreal twice and a half to thrice and a half as long as deep; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; three lower labials in contact with the single pair of chin-shields, which are moderately large, and separated from the symphysial. Scales in 17 rows. Ventrals 163-182; anal entire; subcaudals 30-45. Brown above, with darker spots, which may be large and light-edged, forming a handsome pattern; labials yellowish, with brown sutures; yellowish beneath, dotted or spotted with brown or black.

Total length 700 millim.; tail 80.

Ecuador, Brazil.

Rabdosoma occipitoalbum, *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 16, and *Icon. Gén.* 11, pl. ii. fig. 4 (1865).

Snout obtuse. Rostral small, as deep as broad, just visible from above; internasals small; præfrontals as long as broad; frontal as long as broad, as long as its distance from the end of the snout, shorter than the parietals; loreal nearly three times as long as deep; two postoculars, lower very small and not in contact with the temporal; temporals 1+2; eight upper labials, fourth and fifth entering the eye; four lower labials in contact with the single pair of chin-shields, which are rather elongate, moderately broad, and separated from the symphysial. Scales in 15 rows. Ventrals 150; anal entire; subcaudals 22. Black above and beneath; parietal shields, temporal and gular regions white.

Total length 205 millim.; tail 24.

Western Andes of Ecuador.

18. *Atractus reticulatus*. (PLATE XV. fig. 3.)

Geophis reticulatus, *Bouleng. Ann. & Mag. N. H.* (5) xvi. 1885, p. 87.

Snout rounded. Rostral a little broader than deep, just visible from above; internasals very small; præfrontals as long as broad; frontal a little broader than long, as long as its distance from the end of the snout, shorter than the parietals; loreal twice as long as deep; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the single pair of chin-shields, which are moderately large and separated from the symphysial. Scales in 15 rows. Ventrals 156; anal entire; subcaudals 26. Pale brownish above, each scale edged with dark brown; an ill-defined dark brown collar; lower parts uniform whitish.

Total length 315 millim.; tail 40.

Southern Brazil.

a. ♀ (V. 156, C. 26). S. Lorenzo, Rio Grande Dr. H. von Ihering [C.].
do Sul. (Type.)

19. *Atractus emmeli*.

Geophis emmeli, *Boettg. Ber. Senckenb. Ges.* 1888, p. 192, fig.

Snout rounded. Rostral somewhat broader than deep, just visible from above; internasals very small; præfrontals as long as broad; frontal nearly once and a half as broad as long, a little shorter than the præfrontals, much shorter than the parietals; loreal more than twice as long as deep; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the single pair of chin-shields, which are rather elongate, moderately broad, and separated from the symphysial. Scales in 15 rows. Ventrals 167-170; anal entire; subcaudals 28-30. Dark brown or olive-grey above, somewhat paler across the back of the head; yellowish, greenish, or greyish

beneath, spotted with black; posterior ventrals and subcaudals black, with light edges.

Total length 303 millim.; tail 34.

River Mapiri, Bolivia.

Rabdosoma longicaudatum, Dum. & Bibr. vii. p. 106 (1854); Günth.

Cat. p. 12 (1858); Jan, *Arch. Zool. Anat. Phys.* ii. 1862, p. 15,

and *Icon. Gén.* 11, pl. i. fig. 2 (1865).

— *favæ*, Jan, *ll. cc.* p. 16, pl. ii. fig. 3.

Snout rounded. Rostral moderately large, a little broader than deep, just visible from above; internasals small, broader than long; præfrontals broader than long; frontal as long as broad, as long as its distance from the frontal, much shorter than the parietals; loreal nearly twice as long as deep; a small præocular sometimes present, above the loreal; two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; a single pair of moderately large chin-shields, in contact with the symphysial and, on each side, with three lower labials. Scales in 17 rows. Ventrals 171–185; anal entire; subcaudals 58–66. Tail long and thick, ending in an obtuse point. Brown above, with darker spots and a rather indistinct darker vertebral line; yellow (red ?) beneath, with large black blotches, which mostly alternate.

Total length 420 millim.; tail 110.

Brazil ?

Elapoides, part., *Jan, l. c.* p. 20.
Colophrys, *Cope, Proc. Ac. Philad.* 1868, p. 130.
Parageophis, *Bocourt, l. c.* p. 534.

Maxillary short, with 7 to 12 small, equal teeth; mandibular teeth subequal. Head small, not distinct from neck; eye small, with round or vertically subelliptic pupil; nostril between two nasals; no præocular, loreal and præfrontal entering the eye; internasals and supraoculars present or absent; parietals in contact with labials. Body cylindrical; scales smooth or keeled, without apical pits, in 15 or 17 rows; ventrals rounded. Tail moderate or short; subcaudals in two rows.

Central and South America.

Fig. 23.

Skull of *Geophis semidoliatus*.*Synopsis of the Species.*

- I. A single pair of chin-shields; scales in 15 rows; ventrals 170.
 1. *poeppigii*, p. 316.

II. Two pairs of chin-shields.

A. Maxillary bone extending in front much beyond the palatines; scales perfectly smooth.

A supraocular; third upper labial entering the eye; scales in 15 rows; ventrals 147-174 2. *semidoliatus*, p. 316.

No supraocular; third and fourth upper labials entering the eye; scales in 17 rows; ventrals 135-144 3. *rhodogaster*, p. 317.

B. Maxillary bone extending in front a little beyond the palatines.

Scales in 15 rows, perfectly smooth; ventrals 176 4. *dugesii*, p. 317.

Scales in 15 rows, striated and keeled; ventrals 129-133. 5. *sallæi*, p. 318.

Scales in 17 rows, striated and keeled on the posterior half of the body; ventrals 131-154 6. *chalybeus*, p. 318.

C. Maxillary bone not extending in front beyond the palatines.

1. Upper portion of rostral not measuring more than one third its distance from the frontal; scales in 15 rows.

Scales perfectly smooth on the anterior part of the body, striated and very feebly keeled further back 7. *hoffmanni*, p. 319.

Scales very distinctly striated and keeled, the keel rather strong on the posterior part of the body and on the tail 8. *dolichocephalus*, [p. 320.]

2. Upper portion of rostral measuring at least two thirds its distance from the frontal; scales all smooth, or those at the base of the tail very faintly keeled.

a. Scales in 15 rows.

A supraocular; præfrontals as broad as long 9. *petersii*, p. 321.

A supraocular; præfrontals longer than broad. 10. *championi*, p. 321.

No supraocular. 11. *godmani*, p. 322.

b. Scales in 17 rows.

First lower labial in contact with its fellow behind the symphysial. 12. *dubius*, p. 322.

Symphysial in contact with the anterior chin-shields 13. *rostralis*, p. 323.

1. *Geophis poeppigii*.

Rhabdosoma poëpigi, Jan, *Arch. Zool. Anat. Phys.* ii. 1862, p. 11, and *Icon. Gén.* 10, pl. iii. fig. 4 (1865).

Eye very small, much shorter than its distance from the mouth. Snout rounded. Rostral rather large, once and a half as broad as deep, the portion visible from above about half as long as its distance from the frontal; internasals and præfrontals much broader than long; frontal much broader than long, as long as its distance from the rostral, much shorter than the parietals; supraocular small; loreal nearly twice as long as deep, shorter than the two nasals together; one postocular; six upper labials, third and fourth entering the eye, fifth largest; a single pair of chin-shields, in contact with four lower labials and separated from the symphysial. Scales smooth, in 15 rows. Ventrals 170; anal entire; subcaudals — ? Brown above; barred brown and white beneath; on the anterior part of the body the white bars of the ventral surface extend some way up the sides; upper lip and temporal region white.

Total length 570 millim.

Brazil.

Catostoma semidoliatum, Cope, *Proc. Ac. Philad.* 1860, p. 339.

Elapoides semidoliatus, Jan, *Arch. Zool. Anat. Phys.* ii. 1862, p. 22, and *Icon. Gén.* 12, pl. ii. fig. 1 (1865).

Maxillary extending considerably beyond the palatine in front, the first tooth below the nostril. Eye extremely small, its length hardly half its distance from the mouth. Snout rounded, projecting. Rostral rather large, a little broader than deep, the portion visible from above measuring one third to two fifths its distance from the frontal; internasals a little broader than long, about two fifths the length of the præfrontals, which are nearly as long as broad; frontal as long as broad, or slightly broader than long; as long as its distance from the rostral, much shorter than the parietals; supraocular small; loreal once and two thirds to twice as long as broad; a minute postocular, sometimes fused with the supraocular; five upper labials, third entering the eye; four lower labials in contact with the anterior chin-shields, which are longer than the posterior and separated from the symphysial. Scales in 15 rows, everywhere perfectly smooth. Ventrals 147–174; anal entire; subcaudals 24–28. More or less regularly barred black and yellow or orange above, uniform yellowish beneath; head and nape black, with a yellowish bar across the temples and the parietal shields.

Total length 330 millim.; tail 30.

Mexico.

Elapoides dugesi, Cope, *Proc. Amer. Philos. Soc.* xxii. 1885, p. 386.

Eye quite as long as its distance from the mouth. Snout rounded, feebly prominent. Rostral broader than deep, the portion visible from above measuring hardly one third its distance from the frontal; internasals nearly twice as broad as long, two fifths the length of the præfrontals, which are as broad as long; frontal slightly longer

than broad, longer than its distance from the end of the snout, shorter than the parietals; a narrow supraocular; loreal nearly twice as long as deep; one postocular; six upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are longer than the posterior and separated from the symphysial. Scales smooth, in 15 rows. Ventrals 176; anal entire; subcaudals 44. Black above, with widely separated yellowish cross bars; lower parts uniform yellowish.

Total length 220 millim.; tail 40.

Tangancienaro, Mexico.

5. *Geophis sallæi*. (PLATE XVI. fig. 1.)

Geophis chalybæa, part., *Günth. Biol. C.-Am., Rept.* p. 87 (1893).

Maxillary extending a little beyond the palatine in front, the first tooth corresponding to the suture between the second and third labial shields. Eye very small, measuring two thirds to three fourths its distance from the mouth. Snout rounded, feebly projecting. Rostral moderate, a little broader than deep, the portion visible from above measuring one fourth to one third its distance from the frontal; internasals much broader than long, one fifth to one fourth the length of the præfrontals, which are longer than broad; frontal as long as broad or slightly broader than long, as long as its distance from the end of the snout, shorter than the parietals; a very small supraocular; loreal twice to twice and a half as long as deep; one postocular; six upper labials, third and fourth entering the eye; three or four lower labials in contact with the anterior chin-shields, which are as long as or a little longer than the posterior and separated from the symphysial. Scales in 15 rows, smooth on the nape, finely striated and feebly but very distinctly keeled on the body and base of tail. Ventrals 129-133; anal entire; subcaudals 30-41. Blackish brown above, scales of outer row lighter in the centre; belly uniform yellowish white; subcaudals edged with brown.

Total length 300 millim.; tail 55.

— *rostralis*, Bocourt, *l. c.* p. 533, pl. xxxi. fig. 10; *Günth. Biol. C.-Am., Rept.* p. 89 (1893).

Rhabdosoma rostrale, Cope, *Bull. U.S. Nat. Mus.* no. 32, 1887, p. 85.

Maxillary not extending beyond palatine in front, the first tooth corresponding to the suture between the second and third labial shields. Eye very small, its length about two thirds its distance from the mouth. Snout obtusely pointed, very prominent. Rostral rather large, as deep as broad, the portion visible from above measuring at least two thirds its distance from the frontal; the internasals may be fused with the præfrontals†; frontal slightly broader than long, as long as its distance from the end of the snout, a little shorter than the parietals; a very small supraocular; loreal once and a half to twice as long as deep; one postocular, sometimes fused with the supraocular; six upper labials, third and fourth entering the eye; anterior chin-shields longer than the posterior, in contact with the

* In spec. a the internasals are distinct; in b the left internasal is fused with the præfrontal; in c the internasals are no longer distinguishable.

† As in the specimen in the Collection.

symphysial and with three labials. Scales in 17 rows, perfectly smooth, a few at the base of the tail with faint traces of keels. Ventrals 136-151; anal entire; subcaudals 36-48. Uniform blackish brown above, yellowish white beneath.

Total length 310 millim.; tail 50.

Mexico.

Stilosoma, A. E. Brown, *Proc. Ac. Philad.* 1890, p. 199; Cope, *Proc. U.S. Nat. Mus.* xiv. 1892, p. 595.

Head not distinct from neck; eye moderately small; one nasal; internasals distinct, or fused with the præfrontals; no loreal; præocular present or absent; parietals in contact with the labials. Body very slender, cylindrical and rigid; scales smooth, without pits, in 19 rows; ventrals rounded. Tail short; subcaudals in two rows.

Florida.

1. *Stilosoma extenuatum*.

Stilosoma extenuata, A. E. Brown, *l. c.*

Snout rounded. Rostral prominent but not recurved; supra-

* Mr. A. Erwin Brown informs me (12 Aug., 1893) that, since describing this remarkable new genus, he has received three more specimens from Lake Kerr, Florida, no two of which agree in the lepidosis of the head. I have therefore modified the diagnosis according to the notes he has kindly communicated to me.

ocular short and broad; frontal hexagonal; parietal large, in contact with the fifth labial; two small postoculars; three temporals, the first between the fifth and sixth labials and the parietal; six upper labials, third and fourth entering the eye, fifth largest; three pairs of chin-shields. Scales in 19 rows. Ventrals 235; anal entire; subcaudals 44. Silvery grey above, with a series of dark brown black-edged spots; an elongate triangular dark patch on the parietals, pointing backwards; a dark bar running back from the eye to the upper margin of the labials; fore part of the head maculated with black; lower surface silvery grey, much blotched with black.

Total length 532 millim.; tail 50.

Florida.

116. GEAGRAS.

Geagras, *Cope, Journ. Ac. Philad.* (2) viii. 1876, p. 141.

Sphenocalamus, *Fischer, Oster-Progr. Akad. Gymn. Hamb.* 1883, p. 5.

Maxillary teeth 12, very small, equal; mandibular teeth very small, equal. Head not distinct from neck; snout much depressed, strongly projecting, with angular horizontal edge; eye very small, with round pupil; nostril between two large nasals and the internasal; no loreal, posterior nasal in contact with the præocular. Body cylindrical, short; scales smooth, without apical pits, in 15 rows; ventrals rounded. Tail short; subcaudals in two rows.

Mexico.

1. *Geagras redimitus*.

Geagras redimitus, *Cope, l. c., and Proc. Amer. Philos. Soc.* xxii. 1885, p. 177.

Sphenocalamus lineolatus, *Fischer, l. c.* pl. —. figs. 3–5.

Geophis redimita, *Günth. Biol. C.-Am., Rept.* p. 92 (1893).

Rostral very large, flat beneath, its upper portion convex and as long as its distance from the frontal; internasals broad, shorter than the præfrontals; frontal large, a little longer than broad, longer than its distance from the end of the snout, a little shorter than the parietals; supraocular narrow; one præ- and one postocular; temporals 1+2; six upper labials, fourth bordering the eye, fifth in contact with the parietal; two pairs of chin-shields, anterior in contact with the symphyseal, posterior small. Scales in 15 rows. Ventrals 117–119; anal divided; subcaudals 25–30. Pale reddish above, each scale on the anterior half of the body with a brown median streak; head brown above, with two yellow longitudinal streaks meeting on the rostral; lower parts uniform yellowish.

Total length 185 millim.; tail 25.

Western Mexico.

a. ♀ (V. 117; C. 29).

Mexico.

117. **MACROCALAMUS.**

Macrocalamus, *Günth. Rept. Brit. Ind.* p. 198 (1864).

Maxillary teeth about 10, subequal; mandibular teeth subequal. Head not distinct from neck; eye small, with round pupil; nostril pierced between a nasal and the first upper labial; no internasals; no loreal; a præocular. Body cylindrical; scales smooth, without apical pits, in 15 rows; ventrals rounded. Tail short; subcaudals in two rows.

Malay Peninsula?

1. ***Macrocalamus lateralis*.**

Macrocalamus lateralis, *Günth. l. c.* p. 199, pl. xviii. fig. D.

Rostral deeper than broad, extending on to the upper surface of the head, separating the nasals; frontal longer than broad, a little longer than its distance from the end of the snout, a little shorter than the parietals; one præ- and one postocular: temporals 1+2; eight upper labials, fourth and fifth entering the eye; first lower labial in contact with its fellow behind the symphysial; four lower labials in contact with the anterior chin-shields; posterior chin-shields small and separated from each other. Scales in 15 rows. Ventrals 118; anal entire; subcaudals 20. Reddish brown above, with a few small blackish spots; a dark brown lateral stripe, enclosing a series of small whitish spots; whitish inferiorly, with a few brown dots.

Total length 300 millim.; tail 32.

Malay Peninsula?

a. ♂ (V. 118; C. 20).

(Type.)

118. **IDIOPHOLIS.**

Idiopholis, *Mocquard, Le Natur.* 1892, p. 35, and *Mém. Soc. Zool. Fr.* v. 1892, p. 191.

Maxillary teeth numerous, very small and equal. Head not distinct from neck; eye very small, with round pupil; nostril pierced between two small nasals; a pair of small internasals separated by a small azygous shield; no supraocular; no loreal; no præocular; no anterior temporal. Body cylindrical: scales smooth, without apical pits, in 15 rows; ventrals rounded. Tail short; subcaudals in two rows.

Borneo.

1. ***Idiopholis collaris*.**

Idiopholis collaris, *Mocquard, Le Natur.* 1892, p. 35, and *Mém. Soc. Zool. Fr.* v. 1892, p. 191, pl. vii. fig. 1.

Snout short, obtuse. Rostral narrow, deeper than broad; frontal broader than long, as long as the præfrontals, about half as long as the parietals; six upper labials, third and fourth entering the eye, fifth largest and forming a suture with the parietal; anterior chin-

shields longer than the posterior. Scales in 15 rows. Ventrals 127; anal entire; subcaudals 28. Dark brown above, somewhat lighter beneath; a broad yellowish-white collar behind the parietals.

Total length 190 millim.

Sebrocang Valley, N.E. Borneo.

119. RHABDOPHIDIUM.

Rabdion, part., *Dum. & Bibr. Mém. Ac. Sci.* xxiii. 1853, p. 441, and *Erp. Gén.* vii. p. 115 (1854)*.

Rhabdion, *Günth. Cat. Col. Sn.* p. 243 (1858); *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 28.

Maxillary teeth 10 to 12, subequal; mandibular teeth subequal. Head not distinct from neck; eye small, with round pupil; nostril pierced in a small nasal, which is in contact with or narrowly separated from the præocular; a pair of internasals; no temporals, the parietals in contact with the labials. Body cylindrical; scales smooth, without apical pits, in 15 rows; ventrals rounded. Tail short; subcaudals in two rows.

Celebes.

1. *Rhabdophidium forsteni*.

Rabdion *forsteni*, *Dum. & Bibr.* vii. p. 116 (1854); *Günth. Cat.* p. 243 (1858); *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 29, and *Icon. Gén.* 13, pl. i. fig. 4 (1865).

Snout rather pointed. Rostral broader than deep, well visible from above; suture between the internasals a little shorter than that between the præfrontals; frontal longer than broad, longer than its distance from the end of the snout, a little shorter than the parietals, about twice as broad as the supraocular; a rather large præocular, reaching or nearly reaching the nasal; one post-ocular; five (or six) upper labials, third and fourth entering the eye; first lower labial in contact with its fellow behind the symphysial; three lower labials in contact with the anterior chin-shields, which are longer than the posterior. Scales in 15 rows. Ventrals 137-158; anal entire; subcaudals 22-31. Uniform blackish above, brown beneath.

Total length 370 millim.; tail 45.

Celebes.

a, b. ♀ (V. 153, 158; C. 26, 22). Celebes.

120. PSEUDORHABDIUM.

Rabdion, part., *Dum. & Bibr. Mém. Ac. Sc.* xxiii. 1853, p. 441, and *Erp. Gén.* vii. p. 115 (1854).

Pseudorabdion, *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 10.

Oxycalamus, *Günth. Rept. Brit. Ind.* p. 199 (1864).

Maxillary teeth 10 to 12, subequal; anterior mandibular teeth slightly longer than the posterior. Head not distinct from neck;

* Name preoccupied (*Rhabdium*, Wallr., 1833).

eye small, with round pupil; nostril pierced in a minute nasal; internasals small; no loreal; præocular small or absent; no temporals, the parietals in contact with the labials. Body cylindrical; scales smooth, without apical pits, in 15 rows; ventrals rounded. Tail short; subcaudals in two rows.

Malay Peninsula and Archipelago.

Calamaria, part., *Schleg. Phys. Serp.* ii. p. 25 (1837).

Typhlocalamus, *Günth. Proc. Zool. Soc.* 1872, p. 595.

Maxillary teeth 8 to 11, subequal; anterior mandibular teeth a little longer than the posterior. Head not distinct from neck; eye small, with round pupil; nostril pierced in a minute nasal; no loreal; no internasals; præocular present or absent; no temporals,

Fig. 24.

Skull of *Calamaria linnæi*.

the parietals in contact with the labials. Body cylindrical; scales smooth, without apical pits, in 13 rows; ventrals rounded. Tail short; subcaudals in two rows.

From Assam, Burma, and S. China to the Malay Archipelago.

Synopsis of the Species.

I. 129 to 225 ventrals.

A. Five or six upper labials, third and fourth or fourth and fifth entering the eye.

1. Frontal longer than broad.

a. Symphysial in contact with the chin-shields.

a. Frontal not twice as broad as the supraocular.

* Rostral broader than deep.

Diameter of the eye less than its distance from the mouth 1. *lumbricoidea*, p. 333.

Diameter of the eye equal to its distance from the mouth 2. *vermiformis*, p. 333.

Diameter of the eye more than its distance from the mouth; frontal shorter than the parietals 3. *stahlknechtii*, p. 335.

Diameter of the eye more than its distance from the mouth; frontal as long as the parietals 4. *baluensis*, p. 335.

** Rostral as deep as broad.

† Frontal as long as the parietals.

Frontal once and two thirds as long as broad 5. *grabowskii*, p. 336.

Frontal once and a half as long as broad. 6. *albiventer*, p. 336.

Frontal once and one third as long as broad 7. *margaritifera*, p. 336.

†† Frontal shorter than the parietals.

Ventrals 126-144 8. *prakkii*, p. 337.

Ventrals 175-195 9. *grayi*, p. 338.

β. Frontal at least twice as broad as the supraocular.

Rostral as deep as broad; frontal as long as the parietals 10. *bitorques*, p. 338.

Rostral as deep as broad; frontal shorter than the parietals 11. *gervaisii*, p. 338.

Rostral a little broader than deep; frontal a little shorter than the parietals 12. *sumatrana*, p. 339.

b. First lower labial in contact with its fellow behind the symphysial.

a. A præocular; a postocular.

* Frontal not more than twice as broad as the supraocular.

† Diameter of the eye much more than its distance from the mouth. . 13. *everetti*, p. 340.

†† Diameter of the eye not more than its distance from the mouth.

- Rostral as deep as broad ; first and second labials subequal in size 14. *virgulata*, p. 340.
- Rostral nearly as deep as broad ; second labial larger than first 15. *leucogaster*, p. 341.
- Rostral much broader than deep ; anal divided 16. *occipitalis*, p. 342.
- ** Frontal more than twice as broad as the supra-ocular..... 17. *bicolor*, p. 342.
- β. A præocular ; postocular fused with the supraocular. 18. *lateralis*, p. 342.
- γ. A præocular ; two postoculars. 19. *beccarii*, p. 343.
- δ. No præocular..... 20. *rebentischii*, p. 343.
2. Frontal as broad as long ; rostral broader than deep.
- a. First lower labial in contact with its fellow behind the symphysial.
- No præocular 21. *agamensis*, p. 343.
- A præocular 22. *leucocephala*, p. 344.
- b. Symphysial in contact with the chin-shields ; no præocular. 23. *schlegelii*, p. 345.
- B. Four upper labials, second and third entering the eye.
1. Frontal longer than broad.
- a. Symphysial in contact with the chin-shields.
- α. A præocular.
- Tail obtuse ; the portion of the rostral visible from above shorter than its distance from the frontal 24. *linnaei*, p. 345.
- Tail obtuse ; the portion of the rostral visible from above at least as long as its distance from the frontal..... 25. *borneensis*, p. 347.
- Tail ending in a sharp point..... 26. *benjaminsi*, p. 347.
- β. No præocular 27. *javanica*, p. 347.
- b. First lower labial in contact with its fellow behind the symphysial.
- Frontal as long as the parietals, not twice as broad as the supraocular 28. *brevis*, p. 348.
- Frontal shorter than the parietals, at least twice as broad as the supraocular. 29. *pavimentata*, p. 348.
2. Frontal as broad as long.
- First lower labial in contact with its fellow behind the symphysial ; tail rounded at the end 30. *septentrionalis*, p. 349.

Symphysial in contact with the chin-shields; tail pointed 31. *melanota*, p. 349.

C. Four upper labials, third entering the eye 32. *lovii*, p. 350.

II. Ventrals 300–320; no distinct postocular 33. *gracillima*, p. 350.

1. *Calamaria lumbricoidea*.

- Calamaria lumbricoidea*, Boie, *Isis*, 1827, p. 540; *Schleg. Phys. Serp.* ii. p. 27, pl. i. figs. 14–16 (1837); *Dum. & Bibr.* vii. p. 89 (1854); *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 8, and *Icon. Gén.* 10, pl. ii. fig. 2 (1865); v. *Lidth de Jeude, Notes Leyd. Mus.* xii. 1890, p. 254.
 — *lumbricoidea*, part., *Günth. Cat.* p. 5 (1858).
 — *variabilis*, v. *Lidth de Jeude*, in *M. Weber, Zool. Ergebn.* p. 183, pl. xvi. fig. 8 (1890).

Rostral broader than deep, well visible from above; frontal longer than broad, slightly shorter than the parietals, not twice as broad as the supraocular; one præ- and one postocular; diameter of the eye less than its distance from the mouth; five upper labials, the four anterior subequal in size, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; both pairs of chin-shields in contact with each other. 13 rows of scales. Ventrals 177–217; anal entire; subcaudals 16–23. Tail ending in a point. Dark brown above, whitish inferiorly; lower surface of the tail with a dark brown longitudinal streak.

Total length 420 millim.; tail 35.

Java; Celebes.

A. Head uniform dark brown above.

a. ♂ (V. 191; C. 22). Java. Leyden Museum.

B. A yellowish band across the parietal shields.

b. ♂ (V. 177; C. 19). Java.

2. *Calamaria vermiformis*.

- Calamaria vermiformis*, *Dum. & Bibr.* vii. p. 85 (1854); *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 8, and *Icon. Gén.* 10, pl. ii. fig. 3 (1865).
 — *temminckii*, *Dum. & Bibr. t. c.* p. 87; *Günth. Cat.* p. 5 (1858).
 — *schlegelii* (*non D. & B.*), *Günth. l. c.*
 — *dimidiata*, *Bleek. Nat. Tijdschr. Nederl. Ind.* xxi. 1860, p. 295.
 — *melanorhynchus*, *Bleek. l. c.*
 — *alkeni*, *Bleek. l. c.*
 — *flaviceps*, *Günth. Ann. & Mag. N. H.* (3) xv. 1865, p. 90.
 — *vermiformis*, var. *sumatranus*, v. *Lidth de Jeude, Notes Leyd. Mus.* xii. 1890, p. 18.

Rostral a little broader than deep, visible from above; frontal longer than broad, not twice as broad as the supraocular, shorter than the parietals; a præ- and a postocular; diameter of the eye

equal to its distance from the mouth; five or six upper labials, third and fourth entering the eye; symphyseal in contact with the anterior chin-shields; posterior chin-shields in contact or separated. 13 rows of scales. Ventrals 153-210; anal entire; subcaudals 15-26. Tail ending in a point. Dark brown or black above; beneath yellowish, with or without large black transverse spots or cross bands, or uniform blackish brown.

Total length 410 millim.; tail 33.

Sumatra, Borneo, Java, Moluccas.

A. Head yellow; body with transverse series of small yellowish spots; belly with large black spots or cross bands.

- | | | | |
|--------------------------|----------|----------------|---------------------------------------|
| a. ♀ (V. 164; C. 20). | Sarawak. | Sir J. Brooke | } (Types of
<i>C. flaviceps</i> .) |
| | | [P.] | |
| b. Hgr. (V. 153; C. 26). | Borneo. | A. R. Wallace, | |
| | | Esq. [P.] | |

B. Head yellow, with a black lateral streak, passing through the eye; above with yellowish cross bars disposed regularly, each of which in the middle expands into a longitudinally oval spot; belly barred black and yellow, the yellow bars confluent with the dorsals.

- a. Hgr. (V. 184; C. 26). Mt. Batu-Song, C. Hose, Esq. [C.]
Sarawak, 1000 ft.

C. Head yellow above, entirely or partially; body without spots; belly with black cross bands.

- | | | |

- c, d. ♀ (V. 205, 177; C. 15, 19). Java.
 e. (♂ V. 169; C. 22). Padang, Sumatra.

F. Blackish brown above and below; labial and gular regions and a lateral streak running along the two outer rows of scales yellowish.

- a. ♀ (V. 179; C. 17). Deli, Sumatra. Hr. Hartert [C.]; Fischer Collection.

3. *Calamaria stahlknechtii*.

Calamaria stahlknechtii, *Stoliczka, Journ. As. Soc. Beng.* xlii. 1873, p. 119, pl. xi. fig. 2; *Bouleng. Ann. & Mag. N. H.* (5) xvi. 1885, p. 383.

Rostral a little broader than deep, visible from above; frontal longer than broad, not twice as broad as the supraocular, shorter than the parietals; a præ- and a postocular; diameter of the eye exceeding its distance from the mouth; five upper labials, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; posterior chin-shields separated from each other. Scales in 13 rows. Ventrals 147-163; anal entire; subcaudals 22-23. Tail ending in a point. Uniform brown or olive above; yellowish (red) inferiorly, with or without more or less distinct black transverse spots or cross bands.

Total length 265 millim.; tail 24.

Sumatra and Nias.

- a-c. ♂ (V. 147, 148, 150; C. 23, 22, 22). Nias. Hr. Sundermann [C.].

4. *Calamaria baluensis*. (PLATE XVII. fig. 1.)

Calamaria baluensis, *Bouleng. Proc. Zool. Soc.* 1893, p. 524.

Rostral a little broader than deep, visible from above; frontal nearly twice as long as broad, not twice as broad as the supraocular, as long as the parietals; eye rather large, its diameter much greater than its distance from the mouth; one præ- and one postocular; five upper labials, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; both pairs of chin-shields in contact with each other. 13 rows of scales. Ventrals 175; anal entire; subcaudals 28. Tail ending in a point. Brown above, with small black spots; an interrupted black streak along each side of the head and neck, passing through the eye; upper lip and lower parts white; belly with three longitudinal series of small black spots; a black line along the lower surface of the tail.

Total length 340 millim.; tail 33.

North Borneo.

- a. ♂ (V. 175; C. 28). Mt. Kina Baloo. A. Everett, Esq. [C.].
 (Type.)

5. *Calamaria grabowskii*.

Calamaria grabowskyi, *Fischer, Arch. f. Nat.* 1885, p. 50, pl. iv. fig. 1.

Rostral nearly as deep as broad; frontal once and two thirds as long as broad, not twice as broad as the supraocular, as long as the parietals; a præ- and a postocular; diameter of the eye more than its distance from the mouth; five upper labials, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; both pairs of chin-shields in contact with each other. 13 rows of scales. Ventrals 187; anal entire: subcaudals 20-22. Tail ending in a point. Brown above, with small black spots; ventral shields and outer row of scales black, edged with white.

Total length 430 millim.; tail 32.

Borneo.

a-b. ♀ (V. 187, 187; C. 20, 22). S.E. Borneo. Hr. Grabowsky [C.];
Dr. J. G. Fischer.
(Types.)

5. *Calamaria albiventer*.

Changulia albiventer, *Gray, Ill. Ind. Zool.* ii. pl. lxxxvi. fig. 3 (1834).

Calamaria linnæi, var., *Cantor, Cat. Mal. Rept.* p. 62 (1847).

— *albiventer*, *Günth. Cat.* p. 4 (1858), and *Rept. Brit. Ind.* p. 197 (1864).

Rostral nearly as deep as broad, well visible from above; frontal once and a half as long as broad, as long as the parietals, not twice as broad as the supraocular; one præ- and one postocular; diameter of the eye equal to its distance from the mouth; five upper labials, the four anterior subequal in size, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; both pairs of chin-shields in contact with each other. 13 rows of scales. Ventrals 143-167; anal entire; subcaudals 16-21. Tail ending in a point. Brown above, with four yellow (vermilion) longitudinal streaks; lower parts uniform yellow (carmine), with a black streak running along the junction of the ventrals with the lower row of scales; a black line along the middle of the tail.

Total length 390 millim.; tail 20.

Pinang.

a, b. ♀ (V. 160, 157; C. 17, 17).	Pinang.	Gen. Hardwicke [P.]. (Types.)
c-d. ♀ (V. 167, 166; C. 17, 16).	Pinang.	Dr. Cantor.
e-f. ♂ (V. 143; C. 21) & ♀ (V. 150; C. 16).	—?	

7. *Calamaria margaritifera*. (PLATE XVII. fig. 2.)

Calamaria margaritophora, *Bleeker, Nat. Tijdschr. Nederl. Ind.* xxi. 1860, p. 294.

— *maculolineata*, *Peters, Mon. Berl. Ac.* 1863, p. 403.

Rostral as deep as broad, well visible from above; frontal longer than broad, nearly as long as the parietals, not twice as broad as

the supraocular; one præocular; one postocular; diameter of the eye equal to its distance from the mouth; five upper labials, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; posterior chin-shields separated (or in contact). Scales in 13 rows. Ventrals 165 (149); anal entire; subcaudals 12 (19). Tail ending in a point. Brown above, with longitudinal black lines or series of spots; head blackish above; scales of the outer series with a yellowish spot; lower parts uniform yellowish.

Total length 280 millim.; tail 13.

Sumatra, Java.

a. ♀ (V. 165; C. 12). — ? Dr. Bleeker. (One of the types.)

The following appears to be closely allied to, and may have to be regarded as a colour-variety of, *C. margaritifera* :—

CALAMARIA HOEVENII.

Calamaria hoevenii, *Edeling, Nat. Tijdschr. Nederl. Ind.* xxxi. 1870, p. 380.

Rostral well visible from above; frontal once and a half as long as broad; five upper labials, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; a small scale between the two pairs of chin-shields. 13 rows of scales. Ventrals 169; anal entire; subcaudals 9. Brown above, head marbled with black; back with transverse pale black-edged bands; a series of whitish spots along the outer row of scales; lower parts yellowish with black spots.

Total length 305 millim.; tail 13.

Sumatra.

8. *Calamaria prakcii*.

Calamaria prakkei, v. *Lidth de Jeude, Notes Leyd. Mus.* xv. 1893, p. 252.

Rostral as deep as broad, well visible from above; frontal once and a half as long as broad, shorter than the parietals; one præ- and one postocular; five upper labials, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; no azygous shield between the four chin-shields. Scales in 13 rows. Ventrals 126-144; anal entire; subcaudals 25-30. Tail obtuse, with a conical scale at the end. Dark brown above, with bluish gloss; scales of the outer row with a light spot; some specimens brown, with rather indistinct blackish longitudinal lines; an indication of a light collar may be present; belly yellow, with or without small dark spots; lower surface of tail usually with a median black line.

Total length 260 millim.; tail 40.

North Borneo.

9. *Calamaria grayi*.

Calamaria grayi, Günth. Cat. p. 6 (1858).

— philippinica, Steindachn. Verh. zool.-bot. Ges. Wien, xvii. 1867, p. 514, pl. xiii. figs. 4-6.

Snout very short and broadly rounded. Rostral nearly as deep as broad, well visible from above; frontal a little longer than broad, shorter than the parietals, not twice as broad as the supraocular; one præ- and one postocular; diameter of the eye less than its distance from the mouth; five upper labials, the four anterior subequal in size, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; two pairs of chin-shields, in contact with each other. Scales in 13 rows. Ventrals 175-195; anal entire; subcaudals 14-24. Tail ending in a rather obtuse point. Young reddish white, with black rings; adult uniform blackish above, alternately barred black and white below.

Total length 365 millim.; tail 35.

Philippine Islands.

a, b. ♂ (V. 175; C. 24) & yg. (V. 195; C. 16).	Philippines.	H. Cuming, Esq. [C.] (Types.)
---	--------------	----------------------------------

10. *Calamaria bitorques*.

Calamaria gervaisii, part., Günth. Cat. p. 4 (1858).

— bitorques, Peters, Mon. Berl. Ac. 1872, p. 585.

Rostral as deep as broad, well visible from above; frontal longer than broad, as long as the parietals, about twice as broad as the supraocular; one præ- and one postocular; the diameter of the eye nearly equals its distance from the mouth; five upper labials, the four anterior subequal in size, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; both pairs of chin-shields in contact with each other. 13 rows of scales. Ventrals 151-199; anal entire; subcaudals 13-21. Tail ending in a point. Brown above, the young with dark transverse bands separated by yellowish interspaces; only the two or three anterior of these cross bands persist in the adult; lower parts uniform yellowish.

Total length 265 millim.; tail 20.

Philippine Islands.

a. ♀ (V. 199; C. 13).	Luzon.	Dr. A. B. Meyer [C.].
b, c. ♀ (V. 183; C. 15) & yg. (V. 151; C. 18).	Philippines.	H. Cuming, Esq. [C.].
d, e. ♂ (V. 158; C. 20) & yg. (V. 158; C. 21).	Philippines.	Hr. Salmin [C.].

11. *Calamaria gervaisii*.

Calamaria virgulata (non Boie), Eydoux & Gervais, in Guér. Mag. Zool. Cl. iii. 1837, pl. xvi. figs. 7-10, and Voy. Favorite, v. Zool. pl. xxx. figs. 7-10 (1839).

— gervaisii, Dum. & Bibr. vii. p. 76 (1854); Jan, Arch. Zool. Anat. Phys. ii. 1862, p. 8, and Icon. Gén. 10, pl. ii. fig. 1 (1865).

— gervaisii, part., Günth. Cat. p. 4 (1858).

Rostral as deep as broad, well visible from above; frontal longer

than broad, shorter than the parietals, about twice as broad as the supraocular; one præ- and one postocular; diameter of the eye less than its distance from the mouth; five upper labials, the four anterior subequal in size, third and fourth entering the eye; symphysial in contact with the anterior chin-shields; both pairs of chin-shields in contact with each other. 13 rows of scales. Ventrals 152-178; anal entire; subcaudals 12-18. Tail ending in an obtuse point. Brown or blackish above, with or without darker or lighter spots and streaks; a black spot at the outer extremity of each ventral shield, and a blackish line along the lower surface of the tail.

Total length 255 millim.; tail 20.

Philippine Islands.

A. Brown above, with three light dorsal streaks or series of spots bordered by series of black dots; belly uniform yellowish or with a few scattered black dots.

a, b. ♀ (V. 167; C. 13) & Philippines. H. Cuming, Esq. [C].
yg. (V. 170; C. 17).
c. ♀ (V. 171; C. 12). Luzon. Dr. A. B. Meyer [C].

B. Brown above, with four more or less distinct blackish longitudinal lines; ventrals dotted with brown anteriorly.

d, e. ♂ (V. 162; C. 18) & Philippines. H. Cuming, Esq. [C].
♀ (V. 178; C. 12).
f. ♂ (V. 163; C. 17). Philippines. Hr. Salmin [C].

C. Blackish brown above, with minute whitish dots; ventrals black anteriorly.

g. ♀ (V. 169; C. 14). S. Negros. A. Everett, Esq. [C].

12. *Calamaria sumatrana*.

Calamaria sumatrana, *Edeling, Nat. Tijdschr. Nederl. Ind.* xxxi. 1870, p. 379; *Bouleng. Proc. Zool. Soc.* 1890, p. 34; *W. L. Sclater, Journ. As. Soc. Beng.* lx. 1891, p. 233.

Rostral a little broader than deep; frontal longer than broad, a little shorter than the parietals, rather more than twice as broad as the supraocular; one præ- and one postocular; the diameter of the eye equals its distance from the mouth; five upper labials, third and fourth entering the eye; two pairs of chin-shields in contact with each other, the anterior in contact with the symphysial. Scales in 13 rows. Ventrals 129-176; anal entire; subcaudals 12-31*. Tail ending in a point. Reddish brown or dark brown above, with five black longitudinal lines or series of small black spots; each scale of the outer row with a white spot; a more or less distinct yellow collar on the nape, continuous or narrowly interrupted in the middle; sometimes a similar marking at the base of the tail; lower parts uniform yellowish, with a more or less distinct black line along the middle of the tail.

* The male specimen from Singapore in the Calcutta Museum has 129 ventrals and 31 subcaudals.

Total length 265 millim.; tail 12.

Sumatra, Singapore.

- a. ♀ (V. 168; C. 13). District of Deli, Sumatra. Prof. Moesch [C.]
 b-c. ♂ (V. 142; C. 24). Sumatra? Dr. Bleeker.
 & ♀ (V. 153; C. 14).

13. *Calamaria everetti*. (PLATE XVIII. figs. 1 & 2.)

Calamaria everetti, *Bouleng. Proc. Zool. Soc.* 1893, p. 525, and *Ann. & Mag. N. H.* (6) xiv. 1894, p. 84.

Rostral broader than deep, well visible from above; frontal once and a half as long as broad, shorter than the parietals, not twice as broad as the supraocular; one præ- and one postocular; eye rather large, its diameter much more than its distance from the mouth; five upper labials, third and fourth entering the eye; two pairs of chin-shields in contact with each other; first lower labial in contact with its fellow behind the symphysial. Scales in 13 rows. Ventrals 144-184; anal entire; subcaudals 16-23. Tail ending in a point. Brown above, with longitudinal series of darker spots, forming two lines along each side; each scale of the outer row white in the centre, dark brown on the borders; upper surface of head brown, spotted with darker; lower parts yellowish, with a dark line along the middle of the tail.

Total length 330 millim.; tail 18.

Borneo, Palawan.

A. Nape dark brown, with a yellow collar; belly unspotted.

- a. Yg. (V. 144; C. 23). Sarawak. A. Everett, Esq. [C.] (Type.)

B. No collar; belly unspotted.

- b. Yg. (V. 175; C. 18). Palawan. A. Everett, Esq. [C.]

C. No collar; a series of black dots along the middle of the belly.

- c. ♀ (V. 184; C. 16). Palawan. A. Everett, Esq. [C.]

14. *Calamaria virgulata*.

Calamaria virgulata, *Boie, Isis*, 1827, p. 540; v. *Lidth de Jeude, Notes Leyd. Mus.* xii. 1890, p. 254.

— *modesta*, *Dum. & Bibr.* vii. p. 74 (1854); *Jan, Arch. Zool. Anat. Phys.* ii. 1862, p. 8, and *Icon. Gén.* 10, pl. ii. fig. 5 (1865); *Günth. Proc. Zool. Soc.* 1873, p. 168.

— monochrous, *Bleek. Nat. Tijdschr. Nederl. Ind.* xxi. 1860, p. 293.

— *bogorensis*, v. *Lidth de Jeude*, in *M. Weber, Zool. Ergebn.* p. 182, pl. xvi. figs. 6 & 7 (1890).

Rostral nearly as deep as broad, well visible from above; frontal longer than broad, shorter than the parietals, about twice as broad as the supraocular; one præ- and one postocular; diameter of the eye equal to its distance from the mouth; five upper labials, third and fourth entering the eye; first pair of lower labials in contact behind the symphysial; two pairs of chin-shields, in contact with each other. Scales in 13 rows. Ventrals 151-199; anal entire; sub-

caudals 15-28. Tail obtuse. Dark brown or black above, uniform or with yellowish spots, or yellowish with brown spots; lower parts blackish, uniform or variegated with yellow, or yellow in the middle and black on the sides.

Total length 440 millim.; tail 30.

Sumatra, Java, Celebes.

A. Dark brown or black above, with yellow spots; lower parts black and yellow.

a-b. ♂ (V. 170; C. 27) Manado, Celebes. Dr. A. B. Meyer [C.]
& ♀ (V. 193; C. 19).

B. Dark brown with yellow spots above, uniform black beneath.

c. ♀ (V. 198; C. 15). Java. Dr. Ploem [C.].

C. Dark brown above, with small black spots or lines, without yellow spots or with only a few on the anterior part of the body; ventrals yellow in the middle, black on the sides.

d. ♀ (V. 199; C. 19). Java. Dr. Ploem [C.].
e-g, h-i. ♂ (V. 158, 156, 156, 163; C. 26, 28, 26, 25) & ♀ (V. 183; C. 15). Rarahan, Java. Dr. Beccari [C.]; Marquis G. Doria [P.].
k-l, m-o. ♂ (V. 164, 162; C. 24, 24) & ♀ (V. 178, 174, 179; C. 20, 18, 19). Mt. Singalang, Sumatra. Dr. Beccari [C.]; Marquis G. Doria [P.].
p. ♀ (V. 196; C. 18). Manado, Celebes. Dr. A. B. Meyer [C.].

D. Uniform black above and below.

q. ♂ (V. 151; C. 22). Fort de Kock, Sumatra. Dr. Bleeker.
(Type of *C. monochrous*.)

15. *Calamaria leucogaster*.

Calamaria leucogaster, Bleeker, *Nat. Tijdschr. Nederl. Ind.* xxi. 1860, p. 293; *Günth. Ann. & Mag. N. H.* (3) xv. 1865, p. 89; *Edeling, Nat. Tijdschr. Nederl. Ind.* xxxi. 1870, p. 381.

— *arcticeps*, *Günth. Ann. & Mag. N. H.* (3) xviii. 1866, p. 25, pl. vi. fig. C.

Snout rather pointed; rostral as deep as broad, well visible from above; frontal longer than broad, shorter than the parietals, about twice as broad as the supraocular; one præ- and one postocular; diameter of the eye equal to its distance from the mouth; five upper labials, second larger than first or third, third and fourth entering the eye, or (spec. *d*) six upper labials, fourth and fifth entering the eye; first pair of lower labials forming a suture behind the symphysial; two pairs of chin-shields, in contact with each other. Scales in 13 rows. Ventrals 133-151; anal entire; subcaudals 14-17. Tail ending in a point. Brown above; nape blackish, followed by a narrow yellow collar; tail with two blackish transverse spots; uniform yellowish inferiorly.

Total length 200 millim.; tail 13.

Sumatra, Borneo.

A. Back uniform purplish brown, with mere traces of darker lines.

- a. Hgr. (V. 133; C. 17). Ampatlawang. Dr. Bleeker.
(One of the types.)

B. Pale brown above, with eight blackish longitudinal lines.

- b. ♀ (V. 151; C. 16). Borneo. L. L. Dillwyn, Esq. [P.].
(Type of *C. arcticeps*.)
c. ♀ (V. 149; C. 14). Borneo. Dr. Collingwood [P.].
d. ♀ (V. 147; C. 14). Labuan. A. Everett, Esq. [C.].
e. Hgr. (V. 143; C. 14). Kina Baloo. A. Everett, Esq. [C.].

16. *Calamaria occipitalis*.

Calamaria occipitalis, Jan, *Arch. Zool. Anat. Phys.* ii. 1862, p. 9, and
Icon. Gén. 10, pl. iii. fig. 1 (1865).

Rostral much broader than deep, just visible from above; frontal longer than broad, as long as the parietals, once and a half as broad as the supraocular; one præocular; one postocular; diameter of the eye less than its distance from the mouth; five upper labials, third and fourth entering the eye; first lower labial in contact with its fellow behind the symphysial; two pairs of chin-shields, in contact with each other. Scales in 13 rows. Ventrals 177-179; anal divided; subcaudals 20-21. Tail ending in a point. Blackish above; upper lip, a band across the occiput, two outer series of scales, and lower parts whitish; a blackish line along the lower surface of the tail.

Total length 500 millim.; tail 40.

Java.

17. *Calamaria bicolor*.

Calamaria bicolor, Dum. & Bibr. vii. p. 78 (1854); Jan, *Arch. Zool. Anat. Phys.* ii. 1862, p. 9, and *Icon. Gén.* 10, pl. ii. fig. 6 (1865).

Rostral as deep as broad, visible from above; frontal longer than broad, nearly as long as the parietals, about thrice as broad as the supraocular; a præocular and a postocular; diameter of the eye a little less than its distance from the mouth; five upper labials, third and fourth entering the eye; first pair of lower labials forming a suture behind the symphysial; two pairs of chin-shields, in contact with each other. Scales in 13 rows. Ventrals 143-152; anal entire; subcaudals 24-29. Tail ending in a point. Black above; upper lip, two outer series of scales, and lower parts whitish; lower surface of tail with or without a black longitudinal line.

Total length 375 millim.; tail 57.

Borneo.

- a. ♂ (V. 143; C. 29). Sarawak. Rajah Brooke [P.].

18. *Calamaria lateralis*.

Calamaria lateralis, Mocquard, *Le Naturaliste*, 1890, p. 154, and
Nouv. Arch. Mus. (3) ii. 1890, p. 136, pl. viii. fig. 4.

Rostral just visible from above; frontal longer than broad, as long as the parietals; one præocular; postocular fused with the supraocular; diameter of the eye less than its distance from the mouth; five upper labials, third and fourth entering the eye, fifth largest; first lower labial in contact with its fellow behind the symphysial; both pairs of chin-shields in contact with each other. 13 rows of scales. Ventrals 146; anal entire; subcaudals 21. Tail ending in a point. Blackish brown, a little lighter below; a white lateral stripe, running along the second and third series of scales.

Total length 245 millim.; tail 12.

Mt. Kina Baloo, N. Borneo.

The fusion of the postocular with the supraocular may prove not to be a constant character.

19. *Calamaria beccarii*.

Calamaria beccarii, Peters, *An. Mus. Genova*, iii. 1872, p. 34.

Rostral visible from above; frontal longer than broad; one præ- and two postoculars; five upper labials; first pair of lower labials in contact behind the symphysial; two pairs of chin-shields, in contact with each other. 13 rows of scales. Ventrals 150; anal entire; subcaudals 16. Brown above, with six darker longitudinal lines; dirty white inferiorly, with a black line along the hinder half of the tail.

Total length 183 millim.; tail 14.

Sarawak, Borneo.

20. *Calamaria rebentischii*. (PLATE XVIII. fig. 3.)

Calamaria rebentischii, Bleek. *Nat. Tijdschr. Nederl. Ind.* xxi. 1860, p. 293.

Rostral broader than deep, well visible from above; frontal a little longer than broad, shorter than the parietals, about twice and a half as broad as the supraocular; no præocular; one postocular; diameter of the eye much less than its distance from the mouth; five upper labials, third and fourth entering the eye; first pair of lower labials forming a suture behind the symphysial; two pairs of chin-shields, in contact with each other. Scales in 13 rows. Ventrals 142; anal entire; subcaudals 29. Tail ending in a rather obtuse point. Purplish brown above, each scale of the outer row with a whitish spot; uniform yellowish inferiorly.

Total length 270 millim.; tail 37.

Borneo.

a. ♂ (V. 142; C. 29).

25. Calamaria borneensis. (PLATE XIX. fig. 1.)

Calamaria borneensis, Bleek. *Nat. Tijdschr. Nederl. Ind.* xxi. 1860, p. 298.

Snout prominent; rostral rather deeper than broad, the portion visible from above at least as long as the suture between the præfrontals; frontal longer than broad, shorter than the parietals, about twice and a half as broad as the supraocular; one præ- and one postocular; diameter of the eye rather less than its distance from the mouth; four upper labials, second much larger than first or third, second and third entering the eye; symphysial in contact with the anterior chin-shields; both pairs of chin-shields in contact with each other. 13 rows of scales. Ventrals 163–192; anal entire; subcaudals 19–21. Tail very obtusely pointed. Dark brown above, uniform or with six black longitudinal lines; some yellowish spots on the sides of the neck and tail; end of tail blackish, or spotted with black.

Total length 330 millim.; tail 24.

Borneo.

- A. A white lateral streak between two black ones, the lower of which extends on the outer ends of the ventrals; belly uniform yellowish in the middle, or with small blackish dots.

26. Calamaria benjaminsii.

Calamaria benjaminsii, Edeling, *Nederl. Tijdschr. Dierk.* ii. 1864, p. 202; *Boettg. Mitth. Geogr. Ges. u. Nat. Mus. Lübeck*, (2) v. 1893, p. —.

Apparently very closely allied to *C. linnaei*, but supraocular smaller and tail pointed. 145–154 ventrals; 17–20 subcaudals. Uniform blackish purple above; the scales of the outer series with a white spot; upper lip and belly reddish; a black streak along the side of the ventrals, and another along the middle of the tail.

Total length 260 millim.; tail 23.

Borneo.

27. Calamaria javanica. (PLATE XIX. fig. 2.)

Calamaria javanica, Bouleng. *Ann. & Mag. N. H.* (6) vii. 1891, p. 279.

Rostral nearly as deep as broad, visible from above; frontal a little longer than broad, shorter than the parietals, thrice as broad as the supraocular; no præocular; one postocular; diameter of the eye nearly equal to its distance from the mouth; four upper labials,

second and fourth largest, second and third entering the eye; symphysial in contact with the anterior chin-shields; posterior chin-shields separated from each other. Scales in 13 rows. Ventrals 181; anal entire; subcaudals 17. End of tail obtuse. Dark brown above, each scale with a lighter dot; a yellowish collar, interrupted in the middle, some distance behind the head; upper lip and lower parts uniform yellowish.

Total length 185 millim.; tail 13.

Java.

a. ♂ (V. 181; C. 17).

Java.

Dr. Ploem [C.]. (Type.)

28. *Calamaria brevis*. (PLATE XIX. fig. 3.)

Calamaria quadrimaculata, part., *Günth. Cat.* p. 4 (1858).

Rostral as deep as broad, well visible from above; frontal longer than broad, nearly as long as the parietals, once and a half as broad as the supraocular; one præ- and one postocular; diameter of the eye exceeding its distance from the mouth; four upper labials, second and fourth largest, second and third entering the eye; first lower labial in contact with its fellow behind the symphysial; two pairs of chin-shields, in contact with each other. Scales in 13 rows. Ventrals 134; anal entire; subcaudals 19. End of tail obtuse. Pale brown above, with darker dots; yellowish inferiorly, with a few black spots.

Total length 125 millim.; tail 10.

Borneo.

(Type.)

b. ♀ (V. 300; C. 14).

Matang.

The following species is doubtful :—

CALAMARIA CATENATA, Blyth, Journ. As. Soc. Beng. xxiii. 1854, p. 287.

Frontal almost as large as the parietals. Scales in 13 rows. Ventrals 187; subcaudals 41. Predominant colour dusky above, formed by minute black specks upon a pale ground-tint; below pale buff and marked with lateral series of square black spots; four black lines throughout above, the upper bordering a pale medial streak, which is simple upon the tail, but along the body forms a concatenation of elongate oval spots; an imperfect whitish-buff collar, and similar marks before and behind the eye.

Assam.

122. TYPHLOGEOPHIS.

Typhlogeophis, Günth. Proc. Zool. Soc. 1879, p. 77.

Maxillary teeth 8, subequal; mandibular teeth subequal. Head not distinct from neck; eye concealed under the ocular shield; no supraocular; nostril pierced in a minute nasal; internasals small; no loreal or præocular; no temporals, the parietals in contact with the labials. Body cylindrical; scales smooth, without apical pits, in 15 rows. Tail short; subcaudals in two rows.

Philippine Islands.

1. *Typhlogeophis brevis*. (PLATE XX. fig. 3.)

Typhlogeophis brevis, Günth. l. c.

Snout rather pointed; rostral very small, nearly as deep as broad, just visible from above; suture between the internasals about half the length of that between the præfrontals; frontal small, as long as broad, shorter than its distance from the end of the snout, half as long as the parietals; five upper labials, fourth in contact with the ocular, fifth very large; two pairs of chin-shields, anterior largest.

Scales in 15 rows. Ventrals 153; anal entire; subcaudals about 15. Uniform blackish, scales and shields with whitish edge.

Total length 330 millim.

Philippine Islands.

a. ♀ (V. 153; C. ♀)

Philippines.

A. Everett, Esq. [C].
(Type.)

The position of the following genera is doubtful:—

AMASTRIDUM.

Cope, Proc. Ac. Philad. 1860, p. 370.

"Body cylindrical, elongate; tail moderate, slender. Head distinct, broad, short, tapering rather abruptly. Superior maxillary teeth in a continuous series, the last abruptly the longest, not grooved. Pupil round. Top of head flat, separated on the muzzle from the sides by an angle. Superciliaries prominent. One anterior, two postoculars. Loreal none. Nasals large, one or two, the nostril situated in the centre of the anterior. Scales on the posterior part of the body slightly keeled. Anal and subcaudal scutellæ divided."

A. VELIFERUM, Cope, *l. c.*

"Scales in 17 longitudinal rows, smooth on the anterior half of the body; posteriorly a few dorsal rows with faint keels, becoming stronger towards the tail, and extending on all the scales near the anal region, where they are tuberculous as in *Aspidura trachyprocta*. Tail nearly one third the total length. Occipital [=parietal] plates large, almost reaching the labials in front, posteriorly acuminate; vertical [=frontal] long, acute behind; superciliaries large, prominent, broad behind. Postfrontals [=præfrontals] small, their anterior outline regularly curved; præfrontals [=internasals] small, quadrangular. Rostral nearly rectangular, not appearing on the surface of the head. Postnasal high, its apex visible from above, opposite the suture between the præ- and postfrontals. Superior labials seven, eye resting on third and fourth. Inferior labials nine. Genæals two pair, the anterior shorter. Gastrosteges 127, urosteges 85. Above and below reddish brown, paler in the centres of the gastrosteges. Every fourth scale of the fifth row on each side pale, the adjacent scales on the fourth and sixth rows generally darker. Top of the head much lighter, varied anteriorly; palest behind the eye and above the labials. The latter are dark with a few light spots."

Total length 355 millim.; tail 120.

Cocuyas de Veraguas, Colombia.

ANOLOPHALLUS.

Megalops (*non Lacép.*), *Hallow. Proc. Ac. Philad.* 1860, p. 488.
Anolophallus, *Cope, Am. Nat.* 1893, p. 480.

"Mandibular teeth increasing in length posteriorly, recurved, nearly straight; two internasals, much smaller than the præfrontals; frontal a little longer than broad, pentangular; a frenal [loreal]; two antoculars; two postoculars; eye resting on the fourth supralabial; pupil ovoid; eyes very prominent; body slender, much compressed; abdomen angular; tail rather short." (*Hallowell*). "A long loreal and no preocular plate." (*Cope*.)

A. MACULATUS.

Megalops maculatus, *Hallow. l. c.*

"21 rows of smooth scales; body presenting numerous subquadrangular and oblique blotches above, of a brown colour; intermediate spaces white with a tinge of yellow; under surface white. Abdominal scuta 170; a bifid præanal; 61 subcaudal scutellæ."

Total length 375 millim.; tail 95.

Tahiti.

Subfam. 3. RHACHIODONTINÆ.

Leptognathiens, part., *Duméril, Mém. Ac. Sc.* xxiii. p. 464, 1853;

Duméril & Bibrón, Erp. Gén. vii. p. 25, 1854.

Rachiodontidæ, *Günther, Cat. Col. Sn.* p. 141, 1858.

Dasypeltinæ, part., *Cope, Proc. Am. Philos. Soc.* xxiii. 1886, p. 494.

Only a few teeth, on the posterior part of the maxillary and dentary bones and on the palatines. Some of the anterior thoracic vertebrae with the hypapophysis much developed, directed forwards, and capped with enamel.

A single genus.

123. DASYPELTIS.

Anodon (*non Lam.*), *Smith, Zool. Journ.* iv. 1829, p. 443.

Dasypeltis, *Wagler, Syst. Amph.* p. 178 (1830); *Günth. Cat. Col. Sn.* p. 141 (1858).

Rachiodon, *Jourdan, Le Temps*, 13. 6. 1833 (?); *Dum. & Bibr. Erp. Gén.* vii. p. 487 (1854); *Jan, Elenco sist. Ofid.* p. 106 (1863).

Tropidonotus, part., *Schleg. Phys. Serp.* ii. p. 297 (1837).

Deirodon, *Owen, Odontogr.* p. 220 (1845).

Teeth very small, few, 3 to 7 in each maxillary, and as many in the mandible; palatine but no pterygoid teeth. Head small, not or scarcely distinct from neck; no mental groove; eye moderate, with vertically elliptic pupil; nostril in a semidivided nasal, which is in contact with the præocular; no loreal. Body cylindrical or slightly compressed, elongate; scales strongly keeled, with apical

pits, in 23 to 27 rows; scales on three or four lateral rows oblique and with more or less distinctly serrated keels; ventrals rounded. Tail moderate; subcaudals in two rows.

Tropical and South Africa.

Snout short, rounded, very convex; rostral broader than deep, just visible from above; internasals a little shorter than the præfrontals; frontal often more or less distinctly grooved along the middle, a little longer than broad, longer than its distance from the end of the snout, as long as the parietals or shorter; one (rarely two) præ- and two (rarely one or three) postoculars; temporals 2+3 or 3+4 (rarely 1+3); seven (rarely six or eight) upper labials, third and fourth (or second and third) entering the eye; a pair of large chin-shields, followed by a pair of smaller ones. Scales in 23 to 27 rows. Ventrals 185-263; anal entire; subcaudals 41-94. Pale olive or pale brown above, uniform or with dark brown spots, usually disposed in three longitudinal series; a Λ -shaped dark marking on the nape, preceded by one or two on the head; the latter may be broken up into spots; upper labials with brown vertical bars; belly yellowish, uniform or dotted or spotted with brown or blackish.

Total length 760 millim.; tail 105.

Africa, as far north as Sennar and Sierra Leone.

- A. Vertebral spots elongate and more or less confluent into a zigzag vertebral band; a black stripe along upper surface of tail; belly spotted with blackish.

a-c. Hgr. ♂ (Sc. 25; V. 189; C. 66), ♀ (Sc. 27; V. 204; C. 59), & yg. (Sc. 26; V. 207; C. 52). Port Elizabeth. H. A. Spencer, Esq. [P.].

Oligodon tæniurus, *F. Müll. Verh. nat. Ges. Basel*, x. 1894, p. 826.

Nasal entire. Portion of rostral visible from above as long as its distance from the frontal; suture between the internasals a little longer than that between the præfrontals; frontal once and a half as long as broad, longer than its distance from the end of the snout, a little shorter than the parietals; loreal as long as deep; one præ- and two postoculars; temporals 1+2; seven upper labials, third and fourth entering the eye; four lower labials in contact with the anterior chin-shields, which are longer than the posterior. Scales in 15 rows. Ventrals 145–154; anal divided; subcaudals 23–28. Dark brown above, anteriorly with small orange dots, posteriorly with a reddish vertebral stripe; flanks pale grey, separated from the belly, on the anterior third of the body, by a black stripe occupying the outer ends of the ventrals; lower parts yellowish white, clouded with fine greyish dots.

Total length 275 millim.; tail 35.

Celebes.

a. ♂ (V. 145; C. 28). Pinogo, Bona Valley. Drs. P. & F. Sarasin [P.].

113 a. **AGROPHIS.**

Agrophis, *F. Müll. Verh. nat. Ges. Basel*, x. 1894, p. 827.

Maxillary teeth 14, subequal; mandibular teeth slightly decreasing in size posteriorly. Head small, not distinct from neck; eye very small, with round pupil; nostril between two nasals, the anterior of which is very small; no præocular, loreal and præfrontal entering the eye; internasals and supraoculars very small; parietals in contact with labials. Body cylindrical; scales smooth, without apical pits, in 15 rows; ventrals rounded. Tail short; subcaudals in two rows.

Celebes.

1. *Agrophis sarasinorum*.

Agrophis sarasinorum, *F. Müll. l. c.* fig.

Snout long, obtusely pointed. Rostral large, the portion visible from above a little shorter than its distance from the frontal; præfrontals twice as long as nasals; frontal large, rhomboidal, as broad as long, as long as its distance from the end of the snout, shorter than the parietals; supraocular very small; a minute postocular; five upper labials, third and fourth entering the eye, fifth largest and forming a long suture with the parietal; symphysial not quite touching the anterior chin-shields, which are a little longer than the posterior. Scales in 15 rows. Ventrals 139–141; anal entire; subcaudals 37–40. Tail pointed. Blackish brown above, strongly iridescent, whitish beneath; ventrals and subcaudals darker in front.

Total length 190 millim.; tail 30.

Celebes.

a. ♀ (V. 141; C. 37). Gunung Masarang. Drs. P. & F. Sarasin [P.].

LIST OF PLATES.

PLATE I.

- Fig. 1. *Phrynonax eutropis*, Blgr., p. 22.
2. *Coluber janseni*, Blkr., p. 57.
Upper and side views of head and neck.

PLATE II.

- Spilotes megalolepis*, Gthr., p. 24.
Upper, lower, and side views of head and neck.

PLATE III.

- Fig. 1. *Coluber frenatus*, Gray, p. 58.
2. *Leptophis occidentalis*, Gthr., p. 111.
3. — *nigromarginatus*, Gthr., p. 112.
Upper view of head and anterior part of body, and
side view of head.

PLATE IV.

- Fig. 1. *Dendrophis bifrenalis*, Blgr., p. 80. Upper view of head
and neck.
1 a. — —. Side view of head.
1 b. — —. Side view of middle of body.
2. — *grandoculis*, Blgr., p. 84. Upper view of head
and neck.
2 a. — —. Side view of head.

Fig. 3. *Dendrophis gastrostictus*, Blgr., p. 86. Upper view of head and neck.

3 a. ———. Side view of head.

3 b. ———. Lower view of middle of body.

4. *Dendrelaphis modestus*, Blgr., p. 91. Upper view of head and neck.

4 a. ———. Side view of head.

PLATE V.

Fig. 1. *Chlorophis emini*, Gthr., p. 92.

2. ——— *hoplogaster*, Gthr., p. 93.

3. ——— *heterolepidotus*, Gthr., p. 95.

4. *Philothamnus nitidus*, Gthr., p. 100.

Upper, lower, and side views of head and neck.

PLATE VI.

Fig. 1. *Hypsirhynchus ferox*, Gthr., p. 117.

2. *Liophis fraseri*, Blgr., p. 131.

3. ——— *callicemus*, Gosse, p. 142.

Upper view of head and anterior part of body, and side view of head.

PLATE VII.

Fig. 1. *Xenodon guentheri*, Blgr., p. 147.

2. *Aporophis coralliventris*, Blgr., p. 159.

3. *Rhadinæa jægeri*, Gthr., p. 170.

Upper and side views of head and anterior part of body.

PLATE VIII.

Fig. 1. *Hypsiglena affinis*, Blgr., p. 210. Upper view of head and anterior part of body.

1 a. ———. Side view of head and anterior part of body.

2. *Simotes formosanus*, Gthr., p. 222. Upper view of head and anterior part of body.

2 a. ———. Side view of head and anterior part of body.

Fig. 3. *Simotes annulifer*, Blgr., p. 226. Upper view of head and anterior part of body.

3 a. ———. Side view of head and anterior part of body.

3 b. ———. Enlarged upper view of head.

PLATE IX.

Fig. 1. *Simotes chinensis*, Gthr., p. 228.

2. ——— *beddomii*, Blgr., p. 229.

3. ——— *theobaldi*, Gthr., p. 230.

Upper and side views of head and anterior part of body, and enlarged upper and side views of head.

PLATE X.

Fig. 1. *Simotes cruentatus*, Gthr., p. 231.

2. *Oligodon travancoricus*, Bedd., p. 236.

3. ——— *modestus*, Gthr., p. 238.

Upper, lower, and side views of head and anterior part of body.

PLATE XI.

Fig. 1. *Oligodon everetti*, Blgr., p. 239.

2. ——— *vertebralis*, Gthr., p. 245.

3. ——— *waandersii*, Blkr., p. 245.

Upper and side views of head and anterior part of body, and enlarged upper and side views of head.

PLATE XII.

Fig. 1. *Leptocalamus sclateri*, Blgr., p. 251. Upper and side views of head and anterior part of body, and enlarged upper and side views of head.

2. *Arrhyton taeniatum*, Gthr., p. 252. Enlarged upper, lower, and side views of head.

3. *Contia taylori*, Blgr., p. 265. Upper and side views of head and anterior part of body, and enlarged upper and side views of head.

PLATE XIII.

- Fig. 1. *Homalosoma shiranum*, Blgr., p. 276. Upper view of head and anterior part of body, and enlarged upper and side views of head.
2. — *abyssinicum*, Blgr., p. 276. Upper view of head and anterior part of body, and enlarged upper and side views of head.
3. *Grayia smythii*, Leach, p. 286. Upper and side views of head and anterior part of body.

PLATE XIV.

- Fig. 1. *Tropidodipsas annulifera*, Blgr., p. 297.
2. *Dirosema bicolor*, Gthr., p. 298.
3. *Atractus maculatus*, Gthr., p. 306.
Upper and side views of head and anterior part of body.

PLATE XV.

- Fig. 1. *Atractus modestus*, Blgr., p. 304. Upper and side views of head and anterior part of body.
2. — *vittatus*, Blgr., p. 304. Upper, lower, and side views of head and anterior part of body.
3. — *reticulatus*, Blgr., p. 311. Upper and side views of head and anterior part of body.

PLATE XVI.

- Fig. 1. *Geophis sallaei*, Blgr., p. 318. $\times 3$.
2. — *petersii*, Blgr., p. 321. $\times 3$.
3. — *championi*, Blgr., p. 321. $\times 3$.
4. — *godmani*, Blgr., p. 322. $\times 2\frac{1}{2}$.
Upper, lower, and side views of head.

PLATE XVII.

Fig. 1. *Calamaria baluensis*, Blgr., p. 335.

2. — *margaritifera*, Blkr., p. 336.

Upper, lower, and side views of head and anterior part of body, and lower view of tail.

PLATE XVIII.

Fig. 1. *Calamaria everetti*, Blgr., p. 340.

2. — —, young.

3. — *rebentischii*, Blkr., p. 343.

Upper and side views of head and anterior part of body, and enlarged side views of head.

PLATE XIX.

Fig. 1. *Calamaria borneensis*, Blkr., p. 347.

2. — *javanica*, Blgr., p. 347.

3. — *brevis*, Blgr., p. 348.

4. — *lovii*, Blgr., p. 350.

Upper and side views of head and anterior part of body, and enlarged upper and side views of head.

PLATE XX.

Fig. 1. *Calamaria septentrionalis*, Blgr., p. 349.

2. *Typhlogeophis brevis*, Gthr., p. 351.

Upper, lower, and side views of head and anterior part of body, lower and side views of tail, and enlarged upper view of head.

LIST OF THE CURRENT NATURAL HISTORY PUBLICATIONS OF THE TRUSTEES OF THE BRITISH MUSEUM.

The following publications can be purchased through the Agency of *Messrs. LONGMANS & CO.*, 39, *Paternoster Row*; *Mr. QUARITCH*, 15, *Piccadilly*; *Messrs. KEGAN PAUL, TRENCH, TRÜBNER & CO.*, *Paternoster House, Charing Cross Road*; and *Messrs. DULAU & CO.*, 37, *Soho Square*; or at the NATURAL HISTORY MUSEUM, *Cromwell Road, London, S.W.*

Catalogue of the Specimens and Drawings of Mammals, Birds, Reptiles, and Fishes of Nepal and Tibet. Presented by B. H. Hodgson, Esq., to the British Museum. 2nd edition. By John Edward Gray. Pp. xii., 90. [With an account of the Collection by Mr. Hodgson.] 1863, 12mo. 2s. 3d.
Report on the Zoological Collections made in the Indo-Pacific Ocean during the voyage of H.M.S. "Alert," 1881-2. Pp. xxv., 684. 54 Plates. 1884, 8vo.

Summary of the Voyage	-	By Dr. R. W. Coppinger.
Mammalia	-	" O. Thomas.
Aves	-	" R. B. Sharpe.
Reptilia, Batrachia, Pisces	-	" A. Günther.
Mollusca	-	" E. A. Smith.
Echinodermata	-	" F. J. Bell.
Crustacea	-	" E. J. Miers.
Coleoptera	-	" C. O. Waterhouse.
Lepidoptera	-	" A. G. Butler.
Alcyonaria and Spongiida	-	" S. O. Ridley.

1l. 10s.

MAMMALS.

Catalogue of the Bones of Mammalia in the Collection of the British Museum. By Edward Gerrard. Pp. iv., 296. 1862, 8vo. 5s.

Catalogue of Monkeys, Lemurs, and Fruit-eating Bats in the Collection of the British Museum. By Dr. J. E. Gray, F.R.S., &c. Pp. viii., 137. 21 Woodcuts. 1870, 8vo. 4s.

Catalogue of Carnivorous, Pachydermatous, and Edentate Mammalia in the British Museum. By John Edward Gray, F.R.S., &c. Pp. vii., 398. 47 Woodcuts. 1869, 8vo. 6s. 6d.

- Hand-List of Seals, Morses, Sea-Lions, and Sea-Bears in the British Museum. By Dr. J. E. Gray, F.R.S., &c. Pp. 43. 30 Plates of Skulls. 1874, 8vo. 12s. 6d.
- Catalogue of Seals and Whales in the British Museum. By John Edward Gray, F.R.S., &c. 2nd edition. Pp. vii., 402. 101 Woodcuts. 1866, 8vo. 8s.
- Supplement. By John Edward Gray, F.R.S., &c. Pp. vi., 103. 11 Woodcuts. 1871, 8vo. 2s. 6d.
- List of the Specimens of Cetacea in the Zoological Department of the British Museum. By William Henry Flower, LL.D., F.R.S., &c. [With Systematic and Alphabetical Indexes.] Pp. iv., 36. 1885, 8vo. 1s. 6d.
- Catalogue of Ruminant Mammalia (*Pecora*, Linnæus) in the British Museum. By John Edward Gray, F.R.S., &c. Pp. viii., 102. 4 Plates. 1872, 8vo. 3s. 6d.
- Hand-List of the Edentate, Thick-skinned, and Ruminant Mammals in the British Museum. By Dr. J. E. Gray, F.R.S., &c. Pp. vii., 176. 42 Plates of Skulls, &c. 1873, 8vo. 12s.
- Catalogue of the Marsupialia and Monotremata in the Collection of the British Museum. By Oldfield Thomas. Pp. xiii., 401. 4 coloured and 24 plain Plates. [With Systematic and Alphabetical Indexes.] 1888, 8vo. 1l. 8s.

BIRDS.

Catalogue of the Birds in the British Museum:—

- Vol. III. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Coliormorphæ*, containing the families Corvidæ, Paradiseidæ, Oriolidæ, Dieruridæ, and Prionopidæ. By R. Bowdler Sharpe. Pp. xiii., 343. Woodcuts and 14 coloured Plates. [With Systematic and Alphabetical Indexes.] 1877, 8vo. 17s.
- Vol. IV. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Cichlomorphæ*: Part I., containing the families Campophagidæ and Muscicapidæ. By R. Bowdler Sharpe. Pp. xvi., 494. Woodcuts and 14 coloured Plates. [With Systematic and Alphabetical Indexes.] 1879, 8vo. 1l.
- Vol. V. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Cichlomorphæ*: Part II., containing the family Turdidæ (Warblers and Thrushes). By Henry Seebohm. Pp. xvi., 426. Woodcuts and 18 coloured Plates. [With Systematic and Alphabetical Indexes.] 1881, 8vo. 1l.

Catalogue of the Birds in the British Museum—*continued*.

- Vol. VI. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Cichlomorphæ*: Part III., containing the first portion of the family Timeliidæ (Babbling Thrushes). By R. Bowdler Sharpe. Pp. xiii., 420. Woodcuts and 18 coloured Plates. [With Systematic and Alphabetical Indexes.] 1881, 8vo. 1l.
- Vol. VII. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Cichlomorphæ*: Part IV., containing the concluding portion of the family Timeliidæ (Babbling Thrushes). By R. Bowdler Sharpe. Pp. xvi., 698. Woodcuts and 15 coloured Plates. [With Systematic and Alphabetical Indexes.] 1883, 8vo. 1l. 6s.
- Vol. VIII. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Cichlomorphæ*: Part V., containing the families Paridæ and Laniidæ (Titmice and Shrikes); and *Certhiomorphæ* (Creepers and Nuthatches). By Hans Gadow, M.A., Ph.D. Pp. xiii., 386. Woodcuts and 9 coloured Plates. [With Systematic and Alphabetical Indexes.] 1883, 8vo. 17s.
- Vol. IX. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Cinnyrimorphæ*, containing the families Nectariniidæ and Meliphagidæ (Sun Birds and Honey-eaters). By Hans Gadow, M.A., Ph.D. Pp. xii., 310. Woodcuts and 7 coloured Plates. [With Systematic and Alphabetical Indexes.] 1884, 8vo. 14s.
- Vol. X. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Fringilliformes*: Part I., containing the families Dicæidæ, Hirundinidæ, Ampelidæ, Mniotiltidæ, and Motacillidæ. By R. Bowdler Sharpe. Pp. xiii., 682. Woodcuts and 12 coloured Plates. [With Systematic and Alphabetical Indexes.] 1885, 8vo. 1l. 2s.
- Vol. XI. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Fringilliformes*: Part II., containing the families Cœrebidæ, Tanagridæ, and Icteridæ. By Philip Lutley Sclater, M.A., F.R.S. Pp. xvii., 431. [With Systematic and Alphabetical Indexes.] Woodcuts and 18 coloured Plates. 1886, 8vo. 1l.
- Vol. XII. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Fringilliformes*: Part III., containing the family Fringillidæ. By R. Bowdler Sharpe. Pp. xv., 871. Woodcuts and 16 coloured Plates. [With Systematic and Alphabetical Indexes.] 1888, 8vo. 1l. 8s.
- Vol. XIII. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Sturni-*

Catalogue of the Birds in the British Museum—*continued*.

- formes*, containing the families Artamidæ, Sturnidæ, Ploceidæ, and Alaudidæ. Also the families Atrichidæ and Menuridæ. By R. Bowdler Sharpe. Pp. xvi., 701. Woodcuts and 15 coloured Plates. [With Systematic and Alphabetical Indexes.] 1890, 8vo., 1l. 8s.
- Vol. XIV. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Oligomyodæ*, or the families Tyrannidæ, Oxyrhamphidæ, Pipridæ, Cotingidæ, Phytotomidæ, Philepittidæ, Pittidæ, Xenicidæ, and Eurylæmidæ. By Philip Lutley Selater, M.A., F.R.S. Pp. xix., 494. Woodcuts and 26 coloured Plates. [With Systematic and Alphabetical Indexes.] 1888, 8vo. 1l. 4s.
- Vol. XV. Catalogue of the Passeriformes, or Perching Birds, in the Collection of the British Museum. *Tracheophonæ*, or the families Dendrocolaptidæ, Formicariidæ, Conopophagidæ, and Pterotochidæ. By Philip Lutley Selater, M.A., F.R.S. Pp. xvii., 371. Woodcuts and 20 coloured Plates. [With Systematic and Alphabetical Indexes.] 1890, 8vo. 1l.
- Vol. XVI. Catalogue of the Picariæ in the Collection of the British Museum. *Upupæ* and *Trochili*, by Osbert Salvin. *Coraciæ*, of the families Cypselidæ, Caprimulgidæ, Podargidæ, and Steatornithidæ, by Ernst Hartert. Pp. xvi. 703. Woodcuts and 14 coloured Plates. [With Systematic and Alphabetical Indexes.] 1892, 8vo. 1l. 16s.
- Vol. XVII. Catalogue of the Picariæ in the Collection of the British Museum. *Coraciæ* (contin.) and *Halcyones*, with the families Leptosomatidæ, Coraciidæ, Meropidæ, Alcedinidæ, Momotidæ, Totidæ, and Coliidæ, by R. Bowdler Sharpe. *Bucerotes* and *Trogonæ*, by W. R. Ogilvie Grant. Pp. xi., 522. Woodcuts and 17 coloured Plates. [With Systematic and Alphabetical Indexes.] 1892, 8vo. 1l. 10s.
- Vol. XVIII. Catalogue of the Picariæ in the Collection of the British Museum. *Scansores*, containing the family Picidæ. By Edward Hargitt. Pp. xv., 597. Woodcuts and 15 coloured Plates. [With Systematic and Alphabetical Indexes.] 1890, 8vo. 1l. 6s.
- Vol. XIX. Catalogue of the Picariæ in the Collection of the British Museum. *Scansores* and *Coccyges*: containing the families Rhamphastidæ, Galbulidæ, and Bucconidæ, by P. L. Selater; and the families Indicatoridæ, Capitonidæ, Cuculidæ, and Musophagidæ, by G. E. Shelley. Pp. xii., 484: 13 coloured Plates. [With Systematic and Alphabetical Indexes.] 1891, 8vo. 1l. 5s.
- Vol. XX. Catalogue of the Psittaci, or Parrots, in the Collection of the British Museum. By T. Salvadori.

- Pp. xvii., 658 : woodcuts and 18 coloured Plates. [With Systematic and Alphabetical Indexes.] 1891, 8vo. 17. 10s.
- Vol. XXI. Catalogue of the Columbæ, or Pigeons, in the Collection of the British Museum. By T. Salvadori. Pp. xvii., 676 : 15 coloured plates. [With Systematic and Alphabetical Indexes.] 1893, 8vo. 17. 10s.
- Vol. XXII. Catalogue of the Game Birds (*Pterocletes*, *Gallinæ*, *Opisthocomi*, *Hemipodii*), in the Collection of the British Museum. By W. R. Ogilvie Grant. Pp. xvi., 585 : 8 coloured plates. [With Systematic and Alphabetical Indexes.] 1893, 8vo. 17. 6s.
- Hand-List of Genera and Species of Birds, distinguishing those contained in the British Museum. By G. R. Gray, F.R.S., &c. :—
- Part II. Conirostres, Scansores, Columbæ, and Gallinæ. Pp. xv., 278. [Table of Genera and Subgenera: Part II.] 1870, 8vo. 6s.
- Part III. Struthionæ, Grallæ, and Anseres, with Indices of Generic and Specific Names. Pp. xi., 350. [Table of Genera and Subgenera: Part III.] 1871, 8vo. 8s.
- List of the Specimens of Birds in the Collection of the British Museum. By George Robert Gray :—
- Part III., Sections III. and IV. Capitonidæ and Picidæ. [With Index.] Pp. 137. 1868, 12mo. 1s. 6d.
- Part IV. Columbæ. [With Index.] Pp. 73. 1856, 12mo. 1s. 9d.
- Part V. Gallinæ. Pp. iv., 120. [With an Alphabetical Index.] 1867, 12mo. 1s. 6d.
- Catalogue of the Birds of the Tropical Islands of the Pacific Ocean in the Collection of the British Museum. By George Robert Gray, F.L.S., &c. Pp. 72. [With an Alphabetical Index.] 1859, 8vo. 1s. 6d.

REPTILES.

- Catalogue of the Tortoises, Crocodiles, and Amphisbæniæ in the Collection of the British Museum. By Dr. J. E. Gray, F.R.S., &c. Pp. viii., 80. [With an Alphabetical Index.] 1844, 12mo., 1s.
- Catalogue of Shield Reptiles in the Collection of the British Museum. By John Edward Gray, F.R.S., &c. :—
- Part I. Testudinata (Tortoises). Pp. 79. 50 plates. 1855, 4to. 27. 10s.
- Supplement. With Figures of the Skulls of 36 Genera. Pp. ix., 120. 40 Woodcuts. 1870, 4to. 10s.
- Appendix. Pp. 28. 1872, 4to. 2s. 6d.
- Part II. Emydosaurians, Rhynchocephalia, and Amphisbæniæ. Pp. vi., 41. 25 Woodcuts. 1872, 4to. 3s. 6d.

Hand-List of the Specimens of Shield Reptiles in the British Museum. By Dr. J. E. Gray, F.R.S., F.L.S., &c. Pp. iv., 124. [With an Alphabetical Index.] 1873, 8vo. 4s.

Catalogue of the Chelonians, Rhynchocephalians, and Crocodiles in the British Museum (Natural History). New Edition. By George Albert Boulenger. Pp. x., 311. 73 Woodcuts and 6 Plates. [With Systematic and Alphabetical Indexes.] 1889, 8vo. 15s.

Gigantic Land Tortoises (living and extinct) in the Collection of the British Museum. By Albert C. L. G. Günther, M.A., M.D., Ph.D., F.R.S. Pp. iv., 96. 55 Plates, and two Charts of the Aldabra group of Islands, north-west of Madagascar. [With a Systematic Synopsis of the Extinct and Living Gigantic Land Tortoises.] 1877, 4to. 1l. 10s.

Catalogue of the Lizards in the British Museum (Natural History). Second edition. By George Albert Boulenger:—

Vol. I. Geckonidæ, Eublepharidæ, Uroplatidæ, Pygopodidæ, Agamidæ. Pp. xii., 436. 32 Plates. [With Systematic and Alphabetical Indexes.] 1885, 8vo. 20s.

Vol. II. Iguanidæ, Xenosauridæ, Zonuridæ, Anguidæ, Anniellidæ, Helodermatidæ, Varanidæ, Xantusiidæ, Teiidæ, Amphisbænidæ. Pp. xiii., 497. 24 Plates. [With Systematic and Alphabetical Indexes.] 1885, 8vo. 20s.

Vol. III. Lacertidæ, Gerrhosauridæ, Scincidæ, Anelytropidæ, Dibamidæ, Chamæleontidæ. Pp. xii., 575. 40 Plates. [With a Systematic Index and an Alphabetical Index to the three volumes.] 1887, 8vo. 1l. 6s.

Catalogue of the Snakes in the British Museum (Natural History). Vol. I., containing the families Typhlopidae, Glauconiidae, Boidæ, Ilysiidæ, Uropeltidæ, Xenopeltidæ, and Colubridæ aglyphæ, part. By George Albert Boulenger. Pp. xiii., 448. 26 Woodcuts and 28 plates. [With Systematic and Alphabetical Indexes.] 1893, 8vo. 1l. 1s.

Catalogue of Colubrine Snakes in the Collection of the British Museum. By Dr. Albert Günther. Pp. xvi., 281. [With Geographical, Systematic, and Alphabetical Indexes.] 1858, 12mo. 4s.

BATRACHIANS.

Catalogue of the Batrachia Salientia in the Collection of the British Museum. By Dr. Albert Günther. Pp. xvi., 160. 12 Plates. [With Systematic, Geographical, and Alphabetical Indexes.] 1858, 8vo. 6s.

Catalogue of the Batrachia Salientia, s. Ecaudata, in the Collection of the British Museum. Second Edition. By George Albert Boulenger. Pp. xvi., 503. Woodcuts and 30 Plates. [With Systematic and Alphabetical Indexes.] 1882, 8vo. 1*l.* 10*s.*

Catalogue of the Batrachia Gradientia, s. Caudata, and Batrachia Apoda in the Collection of the British Museum. Second edition. By George Albert Boulenger. Pp. viii., 127. 9 Plates. [With Systematic and Alphabetical Indexes.] 1882, 8vo. 9*s.*

FISHES.

Catalogue of the Fishes in the Collection of the British Museum. By Dr. Albert Günther, F.R.S., &c.:—

Vol. III. *Acanthopterygii* (Gobiidæ, Discoboli, Oxudercidæ, Batrachidæ, Pediculati, Blenniidæ, Acanthoclinidæ, Comephoridæ, Trachypteridæ, Lophotidæ, Teuthididæ, Acronuridæ, Hoplognathidæ, Malacanthidæ, Nandidæ, Polycentridæ, Labyrinthici, Luciocephalidæ, Atherinidæ, Mugilidæ, Ophiocephalidæ, Trichonotidæ, Cepolidæ, Gobiesocidæ, Psychrolutidæ, Centriscidæ, Fistularidæ, Mastacembelidæ, Notacanthi). Pp. xxv., 586. Woodcuts. [With Systematic and Alphabetical Indexes, and a Systematic Synopsis of the families of the Acanthopterygian Fishes.] 1861, 8vo., 10*s.* 6*d.*

Vol. IV. *Acanthopterygii pharyngognathi* and *Anacanthini*. Pp. xxi., 534. [With Systematic and Alphabetical Indexes.] 1862, 8vo. 8*s.* 6*d.*

Vol. V. *Physostomi* (Siluridæ, Characinidæ, Haplochromidæ, Sternoptychidæ, Scopelidæ, Stomiatidæ). Pp. xxii., 455. Woodcuts. [With Systematic and Alphabetical Indexes.] 1864, 8vo. 8*s.*

Vol. VII. *Physostomi* (*Heterophygii*, Cyprinidæ, Gonorhynchidæ, Hyodontidæ, Osteoglossidæ, Clupeidæ, Chirocentridæ, Alepocephalidæ, Notopteridæ, Halosauridæ). Pp. xx., 512. Woodcuts. [With Systematic and Alphabetical Indexes.] 1868, 8vo. 8*s.*

Vol. VIII. *Physostomi* (Gymnotidæ, Symbranchidæ, Murænidæ, Pegasidæ), Lophobranchii, Plectognathi, Dipnoi, Ganoidei, Chondropterygii, Cyclostomata, Lepetocardi. Pp. xxv., 549. [With Systematic and Alphabetical Indexes.] 1870, 8vo. 8*s.* 6*d.*

List of the Specimens of Fish in the Collection of the British Museum. Part I. Chondropterygii. By J. E. Gray. Pp. x., 160. 2 Plates. [With Systematic and Alphabetical Indexes.] 1851, 12mo. 3*s.*

Catalogue of Fish collected and described by Laurence Theodore Gronow, now in the British Museum. Pp. vii., 196. [With a Systematic Index.] 1854, 12mo. 3*s.* 6*d.*

Catalogue of Lophobranchiate Fish in the Collection of the British Museum. By J. J. Kaup, Ph.D., &c. Pp. iv., 80. 4 Plates. [With an Alphabetical Index.] 1856, 12mo. 2s.

MOLLUSCA.

Guide to the Systematic Distribution of Mollusca in the British Museum. Part I. By John Edward Gray, Ph.D., F.R.S., &c. Pp. xii., 230. 121 Woodcuts. 1857, 8vo. 5s.

Catalogue of the Collection of Mazatlan Shells in the British Museum, collected by Frederick Reigen. Described by Philip P. Carpenter. Pp. xvi., 552. 1857, 12mo. 8s.

List of Mollusca and Shells in the Collection of the British Museum, collected and described by MM. Eydoux and Souleyet in the "Voyage autour du Monde, exécuté pendant les années 1836 et 1837, sur la Corvette 'La Bonite,'" and in the "Histoire naturelle des Mollusques Ptéropodes," Par MM. P. C. A. L. Rang et Souleyet. Pp. iv., 27. 1855, 12mo. 8d.

Catalogue of Pulmonata, or Air Breathing Mollusca, in the Collection of the British Museum. Part I. By Dr. Louis Pfeiffer. Pp. iv., 192. Woodcuts. 1855, 12mo. 2s. 6d.

Catalogue of the Auriculidæ, Proserpinidæ, and Truncatellidæ in the Collection of the British Museum. By Dr. Louis Pfeiffer. Pp. iv., 150. Woodcuts. 1857, 12mo. 1s. 9d.

List of the Mollusca in the Collection of the British Museum. By John Edward Gray, Ph.D., F.R.S., &c.

Part I. Volutidæ. Pp. 23. 1855, 12mo. 6d.

Part II. Olividæ. Pp. 41. 1865, 12mo. 1s.

Catalogue of the Conchifera, or Bivalve Shells, in the Collection of the British Museum. By M. Deshayes :—

Part I. Veneridæ, Cyprinidæ, Glauconomidæ, and Petricoladæ. Pp. iv., 216. 1853, 12mo. 3s.

Part II. Petricoladæ (concluded); Corbiculadæ. Pp. 217–292. [With an Alphabetical Index to the two parts.] 1854, 12mo. 6d.

BRACHIOPODA.

Catalogue of Brachiopoda Ancylopoda or Lamp Shells in the Collection of the British Museum. [Issued as "Catalogue of the Mollusca, Part IV."] Pp. iv., 128. 25 Woodcuts. [With an Alphabetical Index.] 1853, 12mo. 3s.

POLYZOA.

Catalogue of Marine Polyzoa in the Collection of the British Museum. Part III. Cyclostomata. By George Busk, F.R.S. Pp. viii., 39. 38 Plates. [With a Systematic Index.] 1875, 8vo. 5s.

CRUSTACEA.

- Catalogue of Crustacea in the Collection of the British Museum.
Part I. Leucosiadæ. By Thomas Bell, V.P.R.S., Pres. L.S.,
&c. Pp. iv., 24. 1855, 8vo. 6d.
- Catalogue of the Specimens of Amphipodous Crustacea in the
Collection of the British Museum. By C. Spence Bate, F.R.S.,
&c. Pp. iv., 399. 58 Plates. [With an Alphabetical Index.]
1862, 8vo. 1l. 5s.

INSECTS.

Coleopterous Insects.

Nomenclature of Coleopterous Insects in the Collection of the
British Museum:—

Part V. Cucujidæ, &c. By Frederick Smith. [*Also issued
as "List of the Coleopterous Insects. Part I."*]
Pp. 25. 1851, 12mo. 6d.

Part VI. Passalidæ. By Frederick Smith. Pp. iv., 23.
1 Plate. [With Index.] 1852, 12mo. 8d.

Part VII. Longicornia, I. By Adam White. Pp. iv., 174.
4 Plates. 1853, 12mo. 2s. 6d.

Part VIII. Longicornia, II. By Adam White. Pp. 237.
6 Plates. 1855, 12mo. 3s. 6d.

Part IX. Cassididæ. By Charles H. Boheman, Professor of
Natural History, Stockholm. Pp. 225. [With Index.]
1856, 12mo. 3s.

Illustrations of Typical Specimens of Coleoptera in the Collection
of the British Museum. Part I. Lycidæ. By Charles Owen
Waterhouse. Pp. x., 83. 18 coloured Plates. [With System-
atic and Alphabetical Indexes.] 1879, 8vo. 16s.

Catalogue of the Coleopterous Insects of Madeira in the Collection
of the British Museum. By T. Vernon Wollaston, M.A., F.L.S.
Pp. xvi., 234: 1 plate. [With a Topographical Catalogue and
an Alphabetical Index.] 1857, 8vo. 3s.

Catalogue of the Coleopterous Insects of the Canaries in the Collec-
tion of the British Museum. By T. Vernon Wollaston, M.A.,
F.L.S. Pp. xiii., 648. [With Topographical and Alphabetical
Indexes.] 1864, 8vo. 10s. 6d.

Catalogue of Halticidæ in the Collection of the British Museum.
By the Rev. Hamlet Clark, M.A., F.L.S. Physapodes and
Ædipodes. Part I. Pp. xii., 301. Frontispiece and 9 Plates.
1860, 8vo. 7s.

Catalogue of Hispidæ in the Collection of the British Museum.
By Joseph S. Baly, M.E.S., &c. Part I. Pp. x., 172. 9
Plates. [With an Alphabetical Index.] 1858, 8vo. 6s.

Hymenopterous Insects.

Catalogue of Hymenopterous Insects in the Collection of the British Museum. By Frederick Smith. 12mo. :—

Part I. Andrenidæ and Apidæ. Pp. 197. 6 Plates. 1853, 2s. 6d.

Part II. Apidæ. Pp. 199–465. 6 Plates. [With an Alphabetical Index.] 1854, 6s.

Part III. Mutillidæ and Pompilidæ. Pp. 206. 6 Plates. 1855, 6s.

Part IV. Sphegidæ, Larridæ, and Crabronidæ. Pp. 207–497. 6 Plates. [With an Alphabetical Index.] 1856, 6s.

Part V. Vespidæ. Pp. 147. 6 Plates. [With an Alphabetical Index.] 1857, 6s.

Part VI. Formicidæ. Pp. 216. 14 Plates. [With an Alphabetical Index.] 1858, 6s.

Part VII. Dorylidæ and Thynnidæ. Pp. 76. 3 Plates. [With an Alphabetical Index.] 1859, 2s.

Descriptions of New Species of Hymenoptera in the Collection of the British Museum. By Frederick Smith. Pp. xxi., 240. [With Systematic and Alphabetical Indexes.] 1879, 8vo. 10s.

List of Hymenoptera, with descriptions and figures of the Typical Specimens in the British Museum. Vol. I., Tenthredinidæ and Siricidæ. By W. F. Kirby. Pp. xxviii., 450. 16 coloured Plates. [With Systematic and Alphabetical Indexes.] 1882, 8vo. 1l. 18s.

Dipterous Insects.

List of the Specimens of Dipterous Insects in the Collection of the British Museum. By Francis Walker, F.L.S. 12mo. :—

Part II. Pp. 231–484. 1849. 3s. 6d.

Part IV. Pp. 689–1172. [With an index to the four parts, and an Index of Donors.] 1849. 6s.

Part V. Supplement I. Stratiomidæ, Xylophagidæ, and Tabanidæ. Pp. iv., 330. 2 Cuts. 1854. 4s. 6d.

Part VI. Supplement II. Acroceridæ and part of the family Asilidæ. Pp. ii., 331–506. 8 Cuts. 1854. 3s.

Part VII. Supplement III. Asilidæ. Pp. ii., 507–775. 1855. 3s. 6d.

Lepidopterous Insects.

Illustrations of Typical Specimens of Lepidoptera Heterocera in the Collection of the British Museum :—

Part I. By Arthur Gardiner Butler. Pp. xiii., 62. 20 Coloured Plates. [With a Systematic Index.] 1877, 4to. 2l.

Illustrations of Typical Specimens of Lepidoptera Heterocera, &c.—continued.

Part III. By Arthur Gardiner Butler. Pp. xviii., 82. 41–60 Coloured Plates. [With a Systematic Index.] 1879, 4to. 2l. 10s.

Part V. By Arthur Gardiner Butler. Pp. xii., 74. 78–100 Coloured Plates. [With a Systematic Index.] 1881, 4to. 2l. 10s.

Part VI. By Arthur Gardiner Butler. Pp. xv., 89. 101–120 Coloured Plates. [With a Systematic Index.] 1886, 4to. 2l. 4s.

Part VII. By Arthur Gardiner Butler. Pp. iv., 124. 121–138 Coloured Plates. [With a Systematic List.] 1889, 4to. 2l.

Part VIII. The Lepidoptera Heterocera of the Nilgiri District. By George Francis Hampson. Pp. iv., 144. 139–156 Coloured Plates. [With a Systematic List.] 1891, 4to. 2l.

Part IX. The Macrolepidoptera Heterocera of Ceylon. By George Francis Hampson. Pp. v., 182. 157–176 Coloured Plates. [With a General Systematic List of Species collected in, or recorded from, Ceylon.] 1893, 4to. 2l. 2s.

Catalogue of Diurnal Lepidoptera of the family Satyridæ in the Collection of the British Museum. By Arthur Gardiner Butler, F.L.S., &c. Pp. vi., 211. 5 Plates. [With an Alphabetical Index.] 1868, 8vo. 5s. 6d.

Catalogue of Diurnal Lepidoptera described by Fabricius in the Collection of the British Museum. By Arthur Gardiner Butler, F.L.S., &c. Pp. iv., 303. 3 Plates. 1869, 8vo. 7s. 6d.

Specimen of a Catalogue of Lycænidæ in the British Museum. By W. C. Hewitson. Pp. 15. 8 Coloured Plates. 1862, 4to. 1l. 1s.

List of Lepidopterous Insects in the Collection of the British Museum. Part I. Papilionidæ. By G. R. Gray, F.L.S. Pp. 106. [With an Alphabetical Index.] 1856, 12mo. 2s.

List of the Specimens of Lepidopterous Insects in the Collection of the British Museum. By Francis Walker. 12mo. :—

Part VI. Lepidoptera Heterocera. Pp. 1258–1507. 1855, 3s. 6d.

Part XIX. Pyralides. Pp. 799–1036. [With an Alphabetical Index to Parts XVI.–XIX.] 1859, 3s. 6d.

Part XX. Geometrites. Pp. 1–276. 1860, 4s.

Part XXI. ——— Pp. 277–498. 1860, 3s.

Part XXII. ——— Pp. 499–755. 1861, 3s. 6d.

Part XXIII. ——— Pp. 756–1020. 1861, 3s. 6d.

Part XXIV. ——— Pp. 1021–1280. 1862, 3s. 6d.

Part XXV. ——— Pp. 1281–1477. 1862, 3s.

Part XXVI. ——— Pp. 1478–1796. [With an Alphabetical Index to Parts XX.–XXVI.] 1862, 4s. 6d.

List of the Specimens of Lepidopterous Insects, &c.—continued.

- Part XXVII. Crambites and Tortricites. Pp. 1-286. 1863, 4s.
- Part XXVIII. Tortricites and Tineites. Pp. 287-561. 1863, 4s.
- Part XXIX. Tineites. Pp. 562-835. 1864, 4s.
- Part XXX. ——— Pp. 836-1096. [With an Alphabetical Index to Parts XXVII.-XXX.] 1864, 4s.
- Part XXXI. Supplement. Pp. 1-321. 1864, 5s.
- Part XXXII. ——— Part 2. Pp. 322-706. 1865, 5s.
- Part XXXIII. ——— Part 3. Pp. 707-1120. 1865, 6s.
- Part XXXIV. ——— Part 4. Pp. 1121-1533. 1865, 5s. 6d.
- Part XXXV. ——— Part 5. Pp. 1534-2040. [With an Alphabetical Index to Parts XXXI.-XXXV.] 1866, 7s.

Neuropterous Insects.

Catalogue of the Specimens of Neuropterous Insects in the Collection of the British Museum. By Francis Walker. 12mo. :—

- Part I. (Phryganides—Perlides.) Pp. iv., 192. 1852, 2s. 6d.
- Part II. Sialidæ—Nemopterides. Pp. ii., 193-476. 1853, 3s. 6d.
- Part III. Termitidæ—Ephemeridæ. Pp. ii., 477-585. 1853, 1s. 6d.
- Part IV. Odonata. Pp. ii., 587-658. 1853, 12mo. 1s.

Catalogue of the Specimens of Neuropterous Insects in the Collection of the British Museum. By Dr. H. Hagen. Part I. Termitina. Pp. 34. 1858, 12mo. 6d.

Orthopterous Insects.

Catalogue of Orthopterous Insects in the Collection of the British Museum. Part I. Phasmidæ. By John Obadiah Westwood, F.L.S., &c. Pp. 195. 48 Plates. [With an Alphabetical Index.] 1859, 4to. 3l.

Catalogue of the Specimens of Blattariæ in the Collection of the British Museum. By Francis Walker, F.L.S., &c. Pp. 239. [With an Alphabetical Index.] 1868, 8vo. 5s. 6d.

Catalogue of the Specimens of Dermaptera Saltatoria [Part I.] and Supplement to the Blattariæ in the Collection of the British Museum. Gryllidæ. Blattariæ. Locustidæ. By Francis Walker, F.L.S., &c. Pp. 224. [With an Alphabetical Index.] 1869, 8vo. 5s.

Catalogue of the Specimens of Dermaptera Saltatoria in the Collection of the British Museum. By Francis Walker, F.L.S., &c.—

Part II. Locustidæ (continued). Pp. 225–423. [With an Alphabetical Index.] 1869, 8vo. 4s. 6d.

Part III. Locustidæ (continued).—Acrididæ. Pp. 425–604. [With an Alphabetical Index.] 1870, 8vo. 4s.

Part IV. Acrididæ (continued). Pp. 605–809. [With an Alphabetical Index.] 1870, 8vo. 6s.

Part V. Tettigidæ.—Supplement to the Catalogue of Blattariæ.—Supplement to the Catalogue of Dermaptera Saltatoria (with remarks on the Geographical Distribution of Dermaptera). Pp. 811–850; 43; 116. [With Alphabetical Indexes.] 1870, 8vo. 6s.

Hemipterous Insects.

List of the Specimens of Hemipterous Insects in the Collection of the British Museum. By W. S. Dallas, F.L.S.:—

Part I. Pp. 368. 11 Plates. 1851, 12mo. 7s.

Part II. Pp. 369–590. Plates 12–15. 1852, 12mo. 4s.

Catalogue of the Specimens of Heteropterous Hemiptera in the Collection of the British Museum. By Francis Walker, F.L.S., &c. 8vo.:—

Part I. Scutata. Pp. 240. 1867. 5s.

Part II. Scutata (continued). Pp. 241–417. 1867. 4s.

Part III. Pp. 418–599. [With an Alphabetical Index to Parts I., II., III., and a Summary of Geographical Distribution of the Species mentioned.] 1868. 4s. 6d.

Part IV. Pp. 211. [Alphabetical Index.] 1871. 6s.

Part V. Pp. 202. ————— 1872. 5s.

Part VI. Pp. 210. ————— 1873. 5s.

Part VII. Pp. 213. ————— 1873. 6s.

Part VIII. Pp. 220. ————— 1873. 6s. 6d.

Homopterous Insects.

List of the Specimens of Homopterous Insects in the Collection of the British Museum. By Francis Walker. Supplement. Pp. ii., 369. [With an Alphabetical Index.] 1858, 12mo. 4s. 6d.

VERMES.

Catalogue of the Species of Entozoa, or Intestinal Worms, contained in the Collection of the British Museum. By Dr. Baird. Pp. iv., 132. 2 Plates. [With an Index of the Animals in which the Entozoa mentioned in the Catalogue are found; and an Index of Genera and Species.] 1853, 12mo. 2s.

ANTHOZOA.

Catalogue of Sea-pens or Pennatulariidæ in the Collection of the British Museum. By J. E. Gray, F.R.S., &c. Pp. iv., 40. 2 Woodcuts. 1870, 8vo. 1s. 6d.

Catalogue of Lithophytes or Stony Corals in the Collection of the British Museum. By J. E. Gray, F.R.S., &c. Pp. iv., 51. 14 Woodcuts. 1870, 8vo. 3s.

Catalogue of the Madreporarian Corals in the British Museum (Natural History). Vol. I. The Genus Madrepora. By George Brook. Pp. xi., 212. 35 Collotype Plates. [With Systematic and Alphabetical Indexes, Explanation of Plates, and a Preface by Dr. Günther.] 1893, 4to. 1l. 4s.

BRITISH ANIMALS.

Catalogue of British Birds in the Collection of the British Museum. By George Robert Gray, F.L.S., F.Z.S., &c. Pp. xii., 248. [With a List of Species.] 1863, 8vo. 3s. 6d.

Catalogue of British Hymenoptera in the Collection of the British Museum. Second edition. Part I. Andrenidæ and Apidæ. By Frederick Smith, M.E.S. New Issue. Pp. xi. 236. 11 Plates. [With Systematic and Alphabetical Indexes.] 1891, 8vo. 6s.

Catalogue of British Fossorial Hymenoptera, Formicidæ, and Vespidæ in the Collection of the British Museum. By Frederick Smith, V.P.E.S. Pp. 236. 6 Plates. [With an Alphabetical Index.] 1858, 12mo. 6s.

A Catalogue of the British Non-parasitical Worms in the Collection of the British Museum. By George Johnston, M.D., Edin., F.R.C.L. Ed., LL.D. Marischal Coll. Aberdeen, &c. Pp. 365. Woodcuts and 24 Plates. [With an Alphabetical Index.] 1865, 8vo. 7s.

Catalogue of the British Echinoderms in the British Museum (Natural History). By F. Jeffrey Bell, M.A. Pp. xvii. 202. Woodcuts and 16 Plates (2 coloured). [With Table of Contents, Tables of Distribution, Alphabetical Index, Description of the Plates, &c.] 1892, 8vo. 12s. 6d.

List of the Specimens of British Animals in the Collection of the British Museum; with Synonyma and References to figures. 12mo. :—

Part V. Lepidoptera. By J. F. Stephens. 1850. 2nd Edition. By H. T. Stainton and E. Shepherd. Pp. iv. 224. 1856, 12mo. 1s. 9d.

Part VII. Mollusca, Acephala, and Brachiopoda. By Dr. J. E. Gray. Pp. iv., 167. 1851, 12mo. 3s. 6d.

Part XI. Anoplura or Parasitic Insects. By H. Denny. Pp. iv., 51. 1852, 1s.

List of the Specimens of British Animals, &c.—*continued*.

Part XIII. Nomenclature of Hymenoptera. By Frederick Smith. Pp. iv., 74. 1853, 12mo. 1s. 4d.

Part XIV. Nomenclature of Neuroptera. By Adam White. Pp. iv., 16. 1853, 12mo. 6d.

Part XV. Nomenclature of Diptera, I. By Adam White. Pp. iv., 42. 1853, 12mo. 1s.

PLANTS.

List of British Diatomaceæ in the Collection of the British Museum.

By the Rev. W. Smith, F.L.S., &c. Pp. iv., 55. 1859, 12mo. 1s.

FOSSILS.

Catalogue of the Fossil Mammalia in the British Museum (Natural History). By Richard Lydekker, B.A., F.G.S.:—

Part I. Containing the Orders Primates, Chiroptera, Insectivora, Carnivora, and Rodentia. Pp. xxx., 268. 33 Woodcuts. [With Systematic and Alphabetical Indexes.] 1885, 8vo. 5s.

Part II. Containing the Order Ungulata, Suborder Artiodactyla. Pp. xxii., 324. 39 Woodcuts. [With Systematic and Alphabetical Indexes.] 1885, 8vo. 6s.

Part III. Containing the Order Ungulata, Suborders Perissodactyla, Toxodontia, Condylarthra, and Amblypoda. Pp. xvi., 186. 30 Woodcuts. [With Systematic Index, and Alphabetical Index of Genera and Species, including Synonyms.] 1886, 8vo. 4s.

Part IV. Containing the Order Ungulata, Suborder Proboscidea. Pp. xxiv., 235. 32 Woodcuts. [With Systematic Index, and Alphabetical Index of Genera and Species, including Synonyms.] 1886, 8vo. 5s.

Part V. Containing the Group Tillodontia, the Orders Sirenia, Cetacea, Edentata, Marsupialia, Monotremata, and Supplement. Pp. xxxv., 345. 55 Woodcuts. [With Systematic Index, and Alphabetical Index of Genera and Species, including Synonyms.] 1887, 8vo. 6s.

Catalogue of the Fossil Birds in the British Museum (Natural History). By Richard Lydekker, B.A. Pp. xxvii., 368. 75 Woodcuts. [With Systematic Index, and Alphabetical Index of Genera and Species, including Synonyms.] 1891, 8vo. 10s. 6d.

Catalogue of the Fossil Reptilia and Amphibia in the British Museum (Natural History). By Richard Lydekker, B.A., F.G.S.:—

Part I. Containing the Orders Ornithosauria, Crocodilia, Dinosauria, Squamata, Rhynchocephalia, and Proterosauria. Pp. xxviii., 309. 69 Woodcuts. [With Systematic Index, and Alphabetical Index of Genera and Species, including Synonyms.] 1888, 8vo. 7s. 6d.

Catalogue of the Fossil Reptilia and Amphibia—continued.

Part II. Containing the Orders Ichthyopterygia and Sauropterygia. Pp. xxi., 307. 85 Woodcuts. [With Systematic Index, and Alphabetical Index of Genera and Species, including Synonyms.] 1889, 8vo. 7s. 6d.

Part III. Containing the Order Chelonina. Pp. xviii., 239. 53 Woodcuts. [With Systematic Index, and Alphabetical Index of Genera and Species, including Synonyms.] 1889, 8vo. 7s. 6d.

Part IV. Containing the Orders Anomodontia, Ecaudata, Caudata, and Labyrinthodontia; and Supplement. Pp. xxiii., 295. 66 Woodcuts. [With Systematic Index, Alphabetical Index of Genera and Species, including Synonyms, and Alphabetical Index of Genera and Species to the entire work.] 1890, 8vo. 7s. 6d.

Catalogue of the Fossil Fishes in the British Museum (Natural History). By Arthur Smith Woodward, F.G.S., F.Z.S.:—

Part I. Containing the Elasmobranchii. Pp. xlvii., 474. 13 Woodcuts and 17 Plates. [With Alphabetical Index, and Systematic Index of Genera and Species.] 1889, 8vo. 21s.

Part II. Containing the Elasmobranchii (Acanthodii), Holocephali, Ichthyodurulites, Ostracodermi, Dipnoi, and Teleostomi (Crossopterygii and Chondrosteian Actinopterygii). Pp. xlv., 567. 58 Woodcuts and 16 Plates. [With Alphabetical Index, and Systematic Index of Genera and Species.] 1891, 8vo. 21s.

Systematic List of the Edwards Collection of British Oligocene and Eocene Mollusca in the British Museum (Natural History), with references to the type-specimens from similar horizons contained in other collections belonging to the Geological Department of the Museum. By Richard Bullen Newton, F.G.S. Pp. xxviii., 365. [With table of Families and Genera, Bibliography, Correlation-table, Appendix, and Alphabetical Index.] 1891, 8vo. 6s.

Catalogue of the Fossil Cephalopoda in the British Museum (Natural History). By Arthur H. Foord, F.G.S.:—

Part I. Containing part of the Suborder Nautiloidea, consisting of the families Orthoceratidæ, Endoceratidæ, Actinoceratidæ, Gomphoceratidæ, Ascoceratidæ, Poterioceratidæ, Cyrtoceratidæ, and Supplement. Pp. xxxi., 344. 51 Woodcuts. [With Systematic Index, and Alphabetical Index of Genera and Species, including Synonyms.] 1888, 8vo. 10s. 6d.

Part II. Containing the remainder of the Suborder Nautiloidea, consisting of the families Lituitidæ, Trochoceratidæ, Nautilidæ, and Supplement. Pp. xxviii., 407. 86 Woodcuts. [With Systematic Index, and Alphabetical Index of Genera and Species, including Synonyms.] 1891, 8vo. 15s.

- A Catalogue of British Fossil Crustacea, with their Synonyms and the Range in Time of each Genus and Order. By Henry Woodward, F.R.S. Pp. xii., 155. [With an Alphabetical Index.] 1877, 8vo. 5s.
- Catalogue of the Blastoidea in the Geological Department of the British Museum (Natural History), with an account of the morphology and systematic position of the group, and a revision of the genera and species. By Robert Etheridge, jun., of the Department of Geology, British Museum (Natural History), and P. Herbert Carpenter, D.Sc., F.R.S., F.L.S. (of Eton College). [With Preface by Dr. H. Woodward, Table of Contents, General Index, Explanations of the Plates, &c.] Pp. xv., 322. 20 Plates. 1886, 4to. 25s.
- Catalogue of the Fossil Sponges in the Geological Department of the British Museum (Natural History). With descriptions of new and little known species. By George Jennings Hinde, Ph.D., F.G.S. Pp. viii., 248. 38 Plates. [With a Tabular List of Species, arranged in Zoological and Stratigraphical sequence, and an Alphabetical Index.] 1883, 4to. 17. 10s.
- Catalogue of the Fossil Foraminifera in the British Museum (Natural History). By Professor T. Rupert Jones, F.R.S., &c. Pp. xxiv., 100. [With Geographical and Alphabetical Indexes.] 1882, 8vo. 5s.
- Catalogue of the Palæozoic Plants in the Department of Geology and Palæontology, British Museum (Natural History). By Robert Kidston, F.G.S. Pp. viii., 288. [With a list of works quoted, and an Index.] 1886, 8vo. 5s.

GUIDE-BOOKS.

(To be obtained only at the Museum.)

- A General Guide to the British Museum (Natural History), Cromwell Road, London, S.W. [By W. H. Flower.] With 2 Plans, 2 views of the building, and an illustrated cover. Pp. 78. 1893, 8vo. 3d.
- Guide to the Galleries of Mammalia (Mammalian, Osteological, Cetacean) in the Department of Zoology of the British Museum (Natural History). [By A. Günther.] 4th Edition. Pp. 126. 57 Woodcuts and 2 Plans. Index. 1892, 8vo. 6d.
- Guide to the Galleries of Reptiles and Fishes in the Department of Zoology of the British Museum (Natural History). [By A. Günther.] 3rd Edition. Pp. iv. 119. 101 Woodcuts and 1 Plan. Index. 1893, 8vo. 6d.
- Guide to the Shell and Starfish Galleries (Mollusca, Echinodermata, Vermes), in the Department of Zoology of the British Museum (Natural History). [By A. Günther.] 2nd Edition. Pp. iv., 74. 51 Woodcuts and 1 Plan. 1888, 8vo. 4d.

A Guide to the Exhibition Galleries of the Department of Geology and Palæontology in the British Museum (Natural History), Cromwell Road, London, S.W. [New Edition. By Henry Woodward.]—

Part I. Fossil Mammals and Birds. Pp. xii., 103. 119 Woodcuts and 1 Plan. 1890, 8vo. 6*d*.

Part II. Fossil Reptiles, Fishes, and Invertebrates. Pp. xii., 109. 94 Woodcuts and 1 Plan. 1890, 8vo. 6*d*.

Guide to the Collection of Fossil Fishes in the Department of Geology and Palæontology, British Museum (Natural History), Cromwell Road, South Kensington. [By Henry Woodward.] 2nd Edition. Pp. 51. 81 Woodcuts. Index. 1888, 8vo. 4*d*.

Guide to Sowerby's Models of British Fungi in the Department of Botany, British Museum (Natural History). By Worthington G. Smith, F.L.S. Pp. 82. 93 Woodcuts. With Table of Diagnostic Characters and Index. 1893, 8vo. 4*d*.

A Guide to the Mineral Gallery of the British Museum (Natural History). [By L. Fletcher.] Pp. 32. Plan. 1893, 8vo. 1*d*.

An Introduction to the Study of Minerals, with a Guide to the Mineral Gallery of the British Museum (Natural History), Cromwell Road, S.W. [By L. Fletcher.] Pp. 120. With numerous Diagrams, a Plan of the Mineral Gallery, and an Index. 1894, 8vo. 6*d*.

The Student's Index to the Collection of Minerals, British Museum (Natural History). New Edition. Pp. 32. With a Plan of the Mineral Gallery. 1893, 8vo. 2*d*.

An Introduction to the Study of Meteorites, with a List of the Meteorites represented in the Collection. [By L. Fletcher.] Pp. 91. [With a Plan of the Mineral Gallery, and an Index to the Meteorites represented in the Collection.] 1893, 8vo. 3*d*.
